Dynamical Systems VII V.I. Arnol'd, S.P. Novikov, 2013-12-14 A collection of five surveys on dynamical systems indispensable for graduate students and researchers in mathematics and theoretical physics Written in the modern language of differential geometry the book covers all the new differential geometric and Lie algebraic methods currently used in the theory of integrable systems **Lie Groups** Wulf Rossmann, 2006 Lie Groups is intended as an introduction to the theory of Lie groups and their representations at the advanced undergraduate or beginning graduate level It covers the essentials of the subject starting from basic undergraduate mathematics The correspondence between linear Lie groups and Lie algebras is developed in its local and global aspects The classical groups are analysed in detail first with elementary matrix methods then with the help of the structural tools typical of the theory of semisimple groups such as Cartan subgroups roots weights and reflections The fundamental groups of the classical groups are worked out as an application of these methods Manifolds are introduced when needed in connection with homogeneous spaces and the elements of differential and integral calculus on manifolds are presented with special emphasis on integration on groups and homogeneous spaces Representation theory starts from first principles such as Schur's lemma and its consequences and proceeds from there to the Peter Weyl theorem Weyl's character formula and the Borel-Weil theorem all in the context of linear groups String-Math 2022 Ron Donagi, Adrian Langer, Piotr Sułkowski, Katrin Wendland, 2024-04-18 This is a proceedings volume from the String Math conference which took place at the University of Warsaw in 2022 This 12th String Math conference focused on several research areas actively developing these days They included generalized categorical symmetries in quantum field theory and their relation to topological phases of matter formal aspects of quantum field theory in particular twisted holography various developments in supersymmetric gauge theories BPS counting and Donaldson-Thomas invariants Other topics discussed at this conference included new advances in Gromov-Witten theory curve counting and Calabi-Yau manifolds Another broad topic concerned algebraic aspects of conformal field theory vertex operator algebras and quantum groups Furthermore several other recent developments were presented during the conference such as understanding the role of operator algebras in the presence of gravity derivation of gauge-string duality complexity of black holes or mathematical aspects of the amplituhedron This proceedings volume contains articles summarizing 14 conference lectures devoted to the above topics **SL2(R)** S. Lang, 2012-12-06 SL2(R) gives the student an introduction to the infinite dimensional representation theory of semisimple Lie groups by concentrating on one example SL2(R) This field is of interest not only for its own sake but for its connections with other areas such as number theory as brought out for example in the work of Langlands The rapid development of representation theory over the past 40 years has made it increasingly difficult for a student to enter the field This book makes the theory accessible to a wide audience its only prerequisites being a knowledge of real analysis and some differential equations **Contact Geometry of Slant Submanifolds** Bang-Yen Chen, Mohammad Hasan Shahid, Falleh

Al-Solamy,2022-06-27 This book contains an up to date survey and self contained chapters on contact slant submanifolds and geometry authored by internationally renowned researchers The notion of slant submanifolds was introduced by Prof B Y Chen in 1990 and A Lotta extended this notion in the framework of contact geometry in 1996 Numerous differential geometers have since obtained interesting results on contact slant submanifolds The book gathers a wide range of topics such as warped product semi slant submanifolds slant submersions semi slant hemi slant Riemannian submersions quasi hemi slant submanifolds slant submanifolds of metric f manifolds slant lightlike submanifolds geometric inequalities for slant submanifolds 3 slant submanifolds and semi slant submanifolds of almost paracontact manifolds The book also includes interesting results on slant curves and magnetic curves where the latter represents trajectories moving on a Riemannian manifold under the action of magnetic field It presents detailed information on the most recent advances in the area making it of much value to scientists educators and graduate students

Automorphic Forms on $SL_2(\mathbb{R})$ Armand

Borel,1997-08-28 This book provides an introduction to some aspects of the analytic theory of automorphic forms on $G \backslash SL_2(\mathbb{R})$ or the upper half plane X with respect to a discrete subgroup Γ of G of finite covolume The point of view is inspired by the theory of infinite dimensional unitary representations of G this is introduced in the last sections making this connection explicit The topics treated include the construction of fundamental domains the notion of automorphic form on $G \backslash G$ and its relationship with the classical automorphic forms on X Poincare series constant terms cusp forms finite dimensionality of the space of automorphic forms of a given type compactness of certain convolution operators Eisenstein series unitary representations of G and the spectral decomposition of $L^2(G \backslash G)$ The main prerequisites are some results in functional analysis reviewed with references and some familiarity with the elementary theory of Lie groups and Lie algebras Graduate students and researchers in analytic number theory will find much to interest them in this book

Representation Theory William

Fulton,Joe Harris,2013-12-01 The primary goal of these lectures is to introduce a beginner to the finite dimensional representations of Lie groups and Lie algebras Since this goal is shared by quite a few other books we should explain in this Preface how our approach differs although the potential reader can probably see this better by a quick browse through the book Representation theory is simple to define it is the study of the ways in which a given group may act on vector spaces It is almost certainly unique however among such clearly delineated subjects in the breadth of its interest to mathematicians This is not surprising group actions are ubiquitous in 20th century mathematics and where the object on which a group acts is not a vector space we have learned to replace it by one that is e g a cohomology group tangent space etc As a consequence many mathematicians other than specialists in the field or even those who think they might want to be come in contact with the subject in various ways It is for such people that this text is designed To put it another way we intend this as a book for beginners to learn from and not as a reference This idea essentially determines the choice of material covered here As simple as is the definition of representation theory given above it fragments considerably when we try to get more specific

Dynamical Systems and Random Processes Jane Hawkins, Rachel L. Rossetti, Jim Wiseman, 2019-09-23 This volume contains the proceedings of the 16th Carolina Dynamics Symposium held from April 13-15, 2018 at Agnes Scott College, Decatur, Georgia. The papers cover various topics in dynamics and randomness including complex dynamics, ergodic theory, topological dynamics, celestial mechanics, symbolic dynamics, computational topology, random processes, and regular languages. The intent is to provide a glimpse of the richness of the field and of the common threads that tie the different specialties together.

Partially Hyperbolic Dynamics, Laminations, and Teichmüller Flow Giovanni Forni, This volume collects a set of contributions by participants of the Workshop Partially hyperbolic dynamics, laminations and Teichmüller flow held at the Fields Institute in Toronto in January 2006. The Workshop brought together several leading experts in two very active fields of contemporary dynamical systems theory: partially hyperbolic dynamics and Teichmüller dynamics. They are unified by ideas coming from the theory of laminations and foliations, dynamical hyperbolicity, and ergodic theory. These are the main themes of the current volume. The volume contains both surveys and research papers on non-uniform and partial hyperbolicity, dominated splitting, and beyond. Part I: Teichmüller dynamics with applications to interval exchange transformations and on the topology of moduli spaces of quadratic differentials. Part II: foliations and laminations and other miscellaneous papers. Part III: Taken together, these papers provide a snapshot of the state of the art in some of the most active topics at the crossroads between dynamical systems, smooth ergodic theory, geometry, and topology, suitable for advanced graduate students and researchers. Non-specialists will find the extensive in-depth surveys especially useful.

Geometry Of Mobius Transformations: Elliptic, Parabolic And Hyperbolic Actions Of $SL_2(\mathbb{R})$ (With Dvd-rom) Vladimir V. Kisil, 2012-06-19 This book is a unique exposition of rich and inspiring geometries associated with Möbius transformations of the hypercomplex plane. The presentation is self-contained and based on the structural properties of the group $SL_2(\mathbb{R})$. Starting from elementary facts in group theory, the author unveils surprising new results about the geometry of circles, parabolas, and hyperbolas using an approach based on the Erlangen programme of F. Klein, who defined geometry as a study of invariants under a transitive group action. The treatment of elliptic, parabolic, and hyperbolic Möbius transformations is provided in a uniform way. This is possible due to an appropriate usage of complex, dual, and double numbers, which represent all non-isomorphic commutative associative two-dimensional algebras with unit. The hypercomplex numbers are in perfect correspondence with the three types of geometries concerned. Furthermore, connections with the physics of Minkowski and Galilean space-time are considered.

Introduction to the Arithmetic Theory of Automorphic Functions Gorō Shimura, 1971-08-21 The theory of automorphic forms is playing increasingly important roles in several branches of mathematics, even in physics, and is almost ubiquitous in number theory. This book introduces the reader to the subject and, in particular, to elliptic modular forms, with emphasis on their number-theoretical aspects. After two chapters geared toward elementary levels, there follows a detailed treatment of the theory of Hecke operators, which

associate zeta functions to modular forms At a more advanced level complex multiplication of elliptic curves and abelian varieties is discussed The main question is the construction of abelian extensions of certain algebraic number fields which is traditionally called Hilbert s twelfth problem Another advanced topic is the determination of the zeta function of an algebraic curve uniformized by modular functions which supplies an indispensable background for the recent proof of Fermat s last theorem by Wiles

Representation of Lie Groups and Special Functions Naum I [A]kovlevich Vilenkin, A.U.

Klimyk, 1991-11-30 This is the first of three major volumes which present a comprehensive treatment of the theory of the main classes of special functions from the point of view of the theory of group representations This volume deals with the properties of classical orthogonal polynomials and special functions which are related to representations of groups of matrices of second order and of groups of triangular matrices of third order This material forms the basis of many results concerning classical special functions such as Bessel MacDonald Hankel Whittaker hypergeometric and confluent hypergeometric functions and different classes of orthogonal polynomials including those having a discrete variable Many new results are given The volume is self contained since an introductory section presents basic required material from algebra topology functional analysis and group theory For research mathematicians physicists and engineers **Compact**

Novikov,1985-08-05 Up until recently Riemannian geometry and basic topology were not included even by departments or faculties of mathematics as compulsory subjects in a university level mathematical education The standard courses in the classical differential geometry of curves and surfaces which were given instead and still are given in some places have come gradually to be viewed as anachronisms However there has been hitherto no unanimous agreement as to exactly how such courses should be brought up to date that is to say which parts of modern geometry should be regarded as absolutely essential to a modern mathematical education and what might be the appropriate level of abstractness of their exposition The task of designing a modernized course in geometry was begun in 1971 in the mechanics division of the Faculty of Mechanics and Mathematics of Moscow State University The subject matter and level of abstractness of its exposition were dictated by the view that in addition to the geometry of curves and surfaces the following topics are certainly useful in the various areas of application of mathematics especially in elasticity and relativity to name but two and are therefore essential the theory of tensors including covariant differentiation of them Riemannian curvature geodesics and the calculus of variations including the conservation laws and Hamiltonian formalism the particular case of skew symmetric tensors i e *Special Functions and the Theory of Group Representations* Naum Ākovlevich Vilenkin,1978 **Hyperbolic Geometry** Birger Iversen,1992-12-17 Although it arose from purely theoretical considerations of the underlying axioms of geometry the work of Einstein and Dirac has demonstrated that hyperbolic geometry is a fundamental aspect of modern physics In this book the rich geometry of the hyperbolic plane is studied in detail leading to the focal point of the book Poincare's polygon theorem and the relationship between hyperbolic geometries and discrete groups of isometries Hyperbolic 3 space is also discussed and the directions that current research in this field is taking are sketched This will be an excellent introduction to hyperbolic geometry for students new to the subject and for experts in other fields Symmetry in Geometry and Analysis, Volume 2 Michael Pevzner,Hideko Sekiguchi,2025-02-10 *Symmetry in Geometry and Analysis* is a Festschrift honoring Toshiyuki Kobayashi The three volumes feature 35 selected contributions from invited speakers of twin conferences held in June 2022 in Reims France and in September 2022 in Tokyo Japan These contributions highlight the profound impact of Prof Kobayashi's pioneering ideas groundbreaking discoveries and significant achievements in the development of analytic representation theory

noncommutative harmonic analysis and the geometry of discontinuous groups beyond the Riemannian context among other areas over the past four decades This second volume of the Festschrift contains original articles on analytic methods in representation theory of reductive Lie groups and related topics Contributions are by Salem Ben Saïd Valentina Casarino Paolo Ciatti Jean Louis Clerc Jan Frahm Joachim Hilgert Toshihisa Kubo Khalid Koufany Quentin Labriet Karl Hermann Neeb Yury Neretin Gestur Ólafsson Bent Ørsted Toshio Oshima Birgit Speh Jorge Vargas and Clemens Weiske *Advances in Geometry and Lie Algebras from Supergravity* Pietro Giuseppe Frè, 2018-02-24 This book aims to provide an overview of several topics in advanced differential geometry and Lie group theory all of them stemming from mathematical problems in supersymmetric physical theories It presents a mathematical illustration of the main development in geometry and symmetry theory that occurred under the fertilizing influence of supersymmetry supergravity The contents are mainly of mathematical nature but each topic is introduced by historical information and enriched with motivations from high energy physics which help the reader in getting a deeper comprehension of the subject Handbook of Dynamical Systems A. Katok, B. Hasselblatt, 2005-12-17 This second half of Volume 1 of this Handbook follows Volume 1A which was published in 2002 The contents of these two tightly integrated parts taken together come close to a realization of the program formulated in the introductory survey Principal Structures of Volume 1A The present volume contains surveys on subjects in four areas of dynamical systems Hyperbolic dynamics parabolic dynamics ergodic theory and infinite dimensional dynamical systems partial differential equations Written by experts in the field The coverage of ergodic theory in these two parts of Volume 1 is considerably more broad and thorough than that provided in other existing sources The final cluster of chapters discusses partial differential equations from the point of view of dynamical systems
