

Nebulas

Our galaxy is filled with beautiful clouds of glowing gas and dust called nebulae. They are the stuff stars are made of and the place where new stars are born. Nebulae glow either because they are illuminated by nearby stars, or because stars within them heat them up. Still other nebulae are dark: they emit no light, and we see them only if they block the light of stars or brighter nebulae behind them.

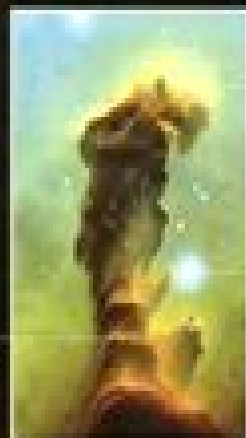

Reflection nebula NGC 1999

This is an example of a reflection nebula. It glows not because stars within it are heating it up, but because it reflects light from stars nearby. It is in the same way that the sea glows on a moonless night. Reflection nebulae and reflection nebulae are found in many places in space.

ubiquitous Meade and Celestron Schmidt Cassegrain telescope ranges and an extensive list of 14 000 objects it will provide a detailed observing guide for almost any practical amateur astronomer up to the most advanced Spanning some 3 000 pages this is a project that is possible only with Springer Extra Materials <http://extras.springer.com> The atlas covers the whole range of objects viewable by amateur astronomers with 8 to 11 inch telescopes from latitude approx 40 degrees The projected total number of objects is currently 13 238 compared with Burnham s approximately 5 000 double stars in three volumes This is much more than just a catalog of objects As planned the atlas will have about 270 double star images and sketches and 590 or so deep sky images and sketches Comparisons with other atlases are invidious but Tirion s atlas and Uranometria for example don t go as deep in magnitude and the scale is unsuitable for star hopping in the eyepiece where the action REALLY takes place The charts in the Complete CD Atlas of the Universe and the scale they are on allow the user to get enough detail to easily find the objects described In addition mirror image charts are supplied for instruments with reverse fields all SCTs This is also much more than planetarium software Many planetarium programs do not have good object databases and those that do have databases that are too large for practical field use For example TheSky one of the most popular and best programs can display the entire Washington Double Star Catalog some 120 000 doubles but 90% of these are not resolvable or evenviewable from certain horizons and there is no way to determine that by looking at the screen The result is that there are more objects plotted on the screen than you can actually see and the clutter makes it very hard to find what you want The pages on Springer Extra Materials are extensively indexed and referenced for quick location of objects areas classes of objects etc The accompanying book gives an introduction to the Atlas showcases the maps thus buyers can see what they are getting without visiting Springer Extra Materials describes the Springer Extra Materials content and organization and includes various appendices
