Industrial Image Processing Christian Demant, Bernd Streicher-Abel, Peter Waszkewitz, 2012-12-06 Digital image processing has become a key technology in the area of manufacturing and quality control Increasing quality demands require inspection of every single part which in turn will lead to a much more widespread

use of automatic visual inspection systems in the near future Furthermore the documentation requirements of ISO 9000 and similar quality control standards can only be met by fully automated networked inspection systems On the other hand despite a multitude of successful applications digital image processing has not yet established itself as an accepted element of manufacturing technology This holds true for the industrial practice as well as for the training of engineers Digital image processing is still widely regarded as some kind of secret lore mastered only by a small number of expensive experts This impression of incomprehensibility frequently leads to the accusation of unreliability The manufacturers of digital image processing systems in the industry are not least responsible for this state of affairs due to their policy of giving the customer as little information as possible about the methods and technology used to inspect his products

Materials Handling Handbook Raymond A. Kulweic, 1991-01-16 Sponsored jointly by the American Society of Mechanical Engineers and International Material Management Society this single source reference is designed to meet today's need for updated technical information on planning installing and operating materials handling systems It not only classifies and describes the standard types of materials handling equipment but also analyzes the engineering specifications and compares the operating capabilities of each type Over one hundred professionals in various areas of materials handling present efficient methods procedures and systems that have significantly reduced both manufacturing and distribution costs

RCS Synthesis for Chipless RFID Olivier Rance, Etienne Perret, Romain Siragusa, Pierre Lemaitre-Augier, 2017-07-26 The considerable growth of RFID is currently accompanied by the development of numerous identification technologies that complement those already available while seeking to answer new problems Chipless RFID is one example The goal is to both significantly reduce the price of the tag and increase the amount of information it contains in order to compete with the barcode while retaining the benefits of a flexible reading approach based on radio communication To solve the problem of the number of bits this book describes the possibility of coding the information at the level of the overall shape of the RCS of the tag which would facilitate reaching very large quantities The design of the tags then returns to the resolution of the inverse problem of the electromagnetic signature The proposed design methodology regularizes the problem by decomposing the signature on a basis of elementary patterns whose signature is chosen in advance Includes a theoretical presentation of scattering phenomenon in electromagnetism regrouping elements from classical RFID pulse radar and antenna theory Features a new coding technique based on magnitude level that is presented and characterized for different kinds of tags Proposes for the first time RCS synthesis based on a physical
