Abstract: **Background:** The aim of the work is to define the morphological peculiarities of the pelvic autonomic nervous system (ANS) and their importance in the clinical and surgical interventions in the lesser pelvis. **Material and methods:** Anatomical variations in the formation of the pelvic ANS were observed in 20 cadavers. The study included 17 men (85%), aged 18 to 84, and 3 women, aged 27 to 86. The average age was 53.8 years. The subjects most often died by violent death in car accidents, by asphyxia, or by sudden death. The study was approved by the Ethics Committee of the Health Care Surveillance Authority, Bratislava, Slovakia. We studied cadavers without congenital or detected anomalies, cancers, deformities of the body, or spinal or abdominal surgeries within 24 h of death. We observed a relationship between the dimensions and the number of ganglia, as well as the number and course of nerve branches and anastomoses. In the pelvic area, we observed the hypogastric plexus superior, hypogastric plexus inferior, and the truncus sympatheticus. In all cadavers, we clarified the lumbosacral plexuses after evisceration. In the lumbosacral region, the roots were defined based on their participation in the formation of the plexuses. To show the intimate relationship between both systems, we also focused on the details of the structure (rami communicantes) related to the connections of the ANS with the spinal nervous system. **Results:** Anatomical variations in the formation of the pelvic ANS were observed in all cases. We included cases with more than two truncus sympatheticus ganglia as the segmental type. The segmental form occurred in 14 (70%) cases, and was concentrated in 6 (30%) cases. Rami communicantes provided anastomoses to the spinal nerves. Small ganglia were observed on the rami communicantes. With the concentrated type, we observed the division of the sympathetic and parasympathetic systems. With the segmental and concentrated forms, symptoms of the "diffuse form" may occur, which we observed in all cases. We observed significant right-left asymmetry and differences in the formation of ganglia and anastomoses. **Conclusions:** This study allowed us to identify and describe the morphological peculiarities of the pelvic ANS and their possible influence on the clinical picture. Asymmetry and dependence of their occurrence on the type of ANS was observed. The variations were frequent. Their preoperative diagnosis is difficult to impossible. The absence or lack of intraoperative vigilance can lead to the damage of pelvic ANS during operations and blockades of the pelvic plexus. The acquired knowledge can be helpful in clarifying clinical signs and symptoms of these conditions.

A History of Nerve Functions Sidney Ochs,2004-04-19 Recent developments have extended our knowledge of the basic functions of nerves notably the demonstration of the mechanism within nerve fibers which transports a wide range of essential materials In order to understand how this discovery occurred it is necessary to examine its history The story begins in ancient Greece when nerves were conceived of as channels through which animal spirits carried sensory impressions to the brain As science developed the discoveries of various physical and chemical agents supplanted the agency of animal spirits until the molecular machinery of transport was recognized In this fascinating and complete history Sidney Ochs begins with a chronological look at this path of discovery followed in the second half by a thematic approach wherein the author describes the electrical nature of the nerve impulse fiber form and its changes in degeneration and regeneration reflexes learning memory and other higher functions in which transport participates *The Central Nervous System of Vertebrates, Vol. 3/II* H. complete in 5 volumes represents a monumental expansion of the early lectures The Physiology of the Lower Urinary Tract Michael Torrens, John F.B. Morrison, 2012-12-06 In this book we attempt a synthesis of knowledge from two investigative extremes On the one hand neurophysiology and neuropharmacology are progressing via the single neuron to a subcellular level on the other clinicians are studying the function of the human urinary system in vivo as a whole A special effort must be made over the next decade to bridge this gap We hope that the information summarized here will catalyse the process In 1968 de Groat and Ryall published a group of papers in the Journal of Physiology in which modern quantitative electrophysiological techniques were applied to the study of the reflexes that regulate bladder function These papers represent a landmark in the history of bladder neurophysiology forming a dividing line between old and new The earlier techniques of lesioning and stimulation of nervous structures yielded mainly qualitative information which was open to criticism because of lack of precise control over what was actually being destroyed or stimulated Much of this earlier work was reviewed in an authoritative volume by Bors and Comarr in 1971 entitled Neurological Urology The 16 years have seen great advances in our understanding of the control of lower subsequent urinary tract function **Spinal Cord Injury** Joost Verhaagen, John W.
