how the collection of the individual components produces the observed tropical weather and climate How the collective tropical processes determine the tropical circulation and their role in global weather and climate is provided in a series of overlapping theoretical and modelling constructs The structure of the book follows a graduated framework Following a detailed description of tropical phenomenology the reader is introduced to dynamical and thermodynamical constraints that guide the planetary climate and establish a critical role for the tropics Equatorial wave theory is developed for simple and complex background flows including the critical role played by moist processes The manner in which the tropics and the extratropics interact is then described followed by a discussion of the physics behind the subtropical and near equatorial precipitation including arid regions The El Niño phenomena and the monsoon circulations are discussed including their covariance and predictability Finally the changing structure of the tropics is discussed in terms of the extent of the tropical ocean warm pool and its relationship to the intensity of global convection and climate change Dynamics of the Tropical Atmosphere and Oceans is aimed at advanced undergraduate and early career graduate students It also serves as an excellent general reference book for scientists interested in tropical circulations and their relationship with the broader climate system
