Making Meaning by Making Connections Kathy L. Schuh, 2016-10-20 This book documents those first links that students make between content they learn in their classrooms and their prior experiences Through six late elementary school case studies these knowledge construction links are brought to life The links of the students are often rich in describing who these individuals are where they are in their learning process and what is meaningful to them Many times these links point to what has been learned both in and out of school and the contexts when and where that learning took place The mind as rhizome metaphor was used to guide the development and interpretation of the studies while the lens of Peircian semiotics provides an interpretation for these initial links The resulting grounded theory is presented through a rich and extensive presentation of excerpts from classroom observations student interviews and a student writing activity and describes the varying types of student links how the links were prompted the relationships between what the students were learning and what they already knew and specific types of in school links The narrative includes how these links were supported or inhibited in the classroom drawing on the roles of the teachers in the classrooms and what constituted authority sources of information in those classrooms Before exploring the students linking as a process

of ongoing semiosis and how this process is part of a dynamic system a study of the relationship between student knowledge links and achievement is shared This rich narrative will be of interest to scholars and practitioners alike and includes an extensive appendix documenting the research methods Data Mining and Methods for Early Detection, Horizon Scanning, Modelling, and Risk Assessment of Invasive Species Aristides Moustakas, Stelios Katsanevakis, 2018-05-03 Invasive alien species are non indigenous taxa introduced to areas beyond their natural distribution and bio geographical barriers by human activity with important impacts on biodiversity human health and ecosystem services With the human population being higher than ever before and increasing together with unprecedented rates of mobility of humans and goods the introduction of new invasive species is more common than ever and is at the forefront of research in many disciplines such as ecology epidemiology and food security The mechanisms of successful introduction establishment and spread of invasive alien species are highly complex as biological social geographic economic and climatic factors influence the way an invasive species is introduced and determine the options available for its eventual detection and control With the rapid development of smart sensors social networks digital maps and remotely sensed imagery spatio temporal data are more ubiquitous and richer than ever before The availability of such large datasets Big data poses great challenges in data analysis In addition increased availability of computing power facilitates the use of computationally intensive methods for the analysis of such data Thus new methods are needed to efficiently study and understand biological invasions A Research Topic held in Frontiers Environmental Informatics aimed to address this topic Methods are defined in the widest terms and may be analytical practical or conceptual Among others a key aim of the thematic was to maximize the use of the proposed methods techniques by the scientific community and environmental stakeholders **Engineering** Great Britain.
