Stability And Switching In Cellular Differentiation:

Stability and Switching in Cellular Differentiation R. M. Clayton, 2013-11-27 *Stability and Switching in Cellular Differentiation* R. M. Clayton, Donald Ernest Samuel Truman, 1982-11 The rapid expansion of our knowledge of gene structure and the details of gene transcription and the translation of RNA to give rise to cellular proteins gives an excitement to this area of research but the organizers believed in the importance of relating this molecular data to current concepts in cell biology and to ideas which have been with us from the earliest days of experimental embryology such as notions of competence and determination The proceedings published here follow the structure of the conference with an introductory session aimed at defining and classifying the problems to be discussed followed by sections on the molecular basis of differentiation and competence on reversible malignancy transdifferentiation and related topics and on strategies of regulation

Current Topics in Developmental Biology, 1986-02-03 *Current Topics in Developmental Biology* Cell Cycle and Cell Differentiation J. Reinert, H. Holtzer, 2013-06-29 It is instructive to compare the response of biologists to the two themes that comprise the title of this volume The concept of the cell cycle in contrast to cell division is a relatively recent one Nevertheless biologists of all persuasions appreciate and readily agree on the central problems in this area Issues ranging from mechanisms that initiate and integrate the synthesis of chromosomal proteins and DNA during S phase of mitosis to the manner in which assembly of microtubules and their interactions lead to the segregation of metaphase chromosomes are readily followed by botanists and zoologists as well as by cell and molecular biologists These problems are crisp and well defined The current state of cell differentiation stands in sharp contrast This one of the oldest problems in experimental biology almost defies definition today The difficulties arise not only from a lack of pertinent information on the regulatory mechanisms but also from conflicting basic concepts in this field One of the ways in which this situation might be improved would be to find a broader experimental basis including a better understanding of the relationship between the cell cycle and cell differentiation

ScholarlyEditions com The Epigenetic Nature of Early Chordate Development Pieter D. Nieuwkoop,A. G. Johnen,B. Albers,1985-08-15 This volume summarises our present knowledge of inductive interaction during early development of various groups of chordates Embryonic development is mainly epigenetic that is each embryo arises through gradual organisation and emergence of its constituent parts and not by the unfolding of preformed structures Development as far as the full development of the body plan in the embryo is described At the beginning of development there is only very restricted spatial diversity but as development proceeds the interaction of the different parts leads to ever increasing spatial complexity of the developing embryo Interaction starts between the different cell organelles of the oocyte and the spermatozoon it continues without interruption between the different parts of the very early embryo and also between the different tissues and organ anlagen of the developing embryo The new hypothesis as to the nature of the inductive interaction which is postulated here is in good agreement with the experimental evidence presented and opens new possibilities for fruitful research into this basic concept of embryonic development **Understanding and Modulating Bone and Cartilage Cell Fate for Regenerative Medicine** Roberto Narcisi,Eric Farrell,2019-04-04
