Stable Homotopy Over The Steenrod Algebra:

Stable Homotopy over the Steenrod Algebra John Harold Palmieri, 2001 This title applies the tools of stable homotopy theory to the study of modules over the mod p Steenrod algebra A . DEGREES More precisely let A be the dual of A . DEGREES then we study the category $\text{mathsf{stable } A}$ of unbounded cochain complexes of injective comodules over A in which the morphisms are cochain homotopy classes of maps. This category is triangulated. Indeed it is a stable homotopy category so we can use Brown representability, Bousfield localization, Brown-Comenetz duality and other homotopy theoretic tools to study it. One focus of attention is the analogue of the stable homotopy groups of spheres which in this setting is the cohomology of A . $\text{Ext}_{A \text{ DEGREES } \mathbf{F}_p} \mathbf{F}_p$. This title also has nilpotence theorems, periodicity theorems, a convergent chromatic tower and a ν .

Spectra and the Steenrod Algebra H.R. Margolis, 2011-08-18 I have intended this book to be more than just the sum of its chapters and the introduction is in part an attempt to spell out what the more is. Algebraic topology is the study of topological problems by algebraic means. More precisely this has come to be framed as the study of topological categories by means of functors to algebraic categories. Beyond the basic definitions and structure the focus is often on particular problems for example Adams' use of K theory to solve the vector fields on spheres problem. On the other hand there are contributions of a more global nature yielding insight into the overall structure of some topological category for example Quillen's work on rational homotopy type. This book is intended primarily as a contribution of this latter sort. So while there will be a variety of particular examples and computations and although the structure being developed has significant application to many specific problems some of which are considered here the major thrust of the text is toward understanding the global structure and linkage of the topological and algebraic categories considered: the stable homotopy category and the category of modules over the Steenrod algebra.

Stable Stems Daniel C. Isaksen, 2019 We present a detailed analysis of 2 complete stable homotopy groups both in the classical context and in the motivic context over C . We use the motivic May spectral sequence to compute the cohomology of the motivic Steenrod algebra over C through the 70 stem. We then use the motivic Adams spectral sequence to obtain motivic stable homotopy groups through the 59 stem. In addition to finding all Adams differentials in this range we also resolve all hidden extensions by 2 η and ν except for a few carefully enumerated exceptions that remain unknown. The analogous classical stable homotopy groups are easy consequences. We also compute the motivic stable homotopy groups of the cofiber of the motivic element τ . This computation is essential for resolving hidden extensions in the Adams spectral sequence. We show that the homotopy groups of the cofiber of τ are the

same as the E2 page of the classical Adams Novikov spectral sequence This allows us to compute the classical Adams Novikov spectral sequence including differentials and hidden extensions in a larger range than was previously known

Steenrod Squares in Spectral Sequences William M. Singer, 2006 This book develops a general theory of Steenrod operations in spectral sequences It gives special attention to the change of rings spectral sequence for the cohomology of an extension of Hopf algebras and to the Eilenberg Moore spectral sequence for the cohomology of classifying spaces and homotopy orbit spaces In treating the change of rings spectral sequence the book develops from scratch the necessary properties of extensions of Hopf algebras and constructs the spectral sequence in a form particularly suited to the introduction of Steenrod squares The resulting theory can be used effectively for the computation of the cohomology rings of groups and Hopf algebras and of the Steenrod algebra in particular and so should play a useful role in stable homotopy theory Similarly the book offers a self contained construction of the Eilenberg Moore spectral sequence in a form suitable for the introduction of Steenrod operations The corresponding theory is an effective tool for the computation of t

May, 1999-09 Algebraic topology is a basic part of modern mathematics and some knowledge of this area is indispensable for any advanced work relating to geometry including topology itself differential geometry algebraic geometry and Lie groups This book provides a detailed treatment of algebraic topology both for teachers of the subject and for advanced graduate students in mathematics either specializing in this area or continuing on to other fields J Peter May's approach reflects the enormous internal developments within algebraic topology over the past several decades most of which are largely unknown to mathematicians in other fields But he also retains the classical presentations of various topics where appropriate Most chapters end with problems that further explore and refine the concepts presented The final four chapters provide sketches of substantial areas of algebraic topology that are normally omitted from introductory texts and the book concludes with a list of suggested readings for those interested in delving further into the field **Algebraic Topology** H.V. Nguyễn, Lionel Schwartz, 2018-01-02 Held during algebraic topology special sessions at the Vietnam Institute for Advanced Studies in Mathematics VIASM Hanoi this set of notes consists of expanded versions of three courses given by G Ginot H W Henn and G Powell They are all introductory texts and can be used by PhD students and experts in the field Among the three contributions two concern stable homotopy of spheres Henn focusses on the chromatic point of view the Morava K_n localization and the cohomology of the Morava stabilizer groups Powell's chapter is concerned with the derived functors of the destabilization and iterated loop functors and provides a small complex to compute them Indications are given for the odd prime case Providing an introduction to some aspects of string and brane topology Ginot's contribution focusses on Hochschild homology and its generalizations It contains a number of new results and fills a gap in the literature

Triangulations of Oriented Matroids Francisco Santos, 2002 We consider the concept of triangulation of an oriented

matroid We provide a definition which generalizes the previous ones by Billera Munson and by Anderson and which specializes to the usual notion of triangulation or simplicial fan in the realizable case Then we study the relation existing between triangulations of an oriented matroid $\mathcal{M}$ and extensions of its dual $\mathcal{M}^*$ via the so called lifting triangulations We show that this duality behaves particularly well in the class of Lawrence matroid polytopes In particular that the extension space conjecture for realizable oriented matroids is equivalent to the restriction to Lawrence polytopes of the Generalized Baues problem for subdivisions of polytopes We finish by showing examples and a characterization of lifting triangulations
