Societies Of Brains:

Societies of Brains Walter J. Freeman, 2014-03-05 This monograph from a leading neuroscientist and neural networks researcher investigates and offers a fresh approach to the perplexing scientific and philosophical problems of minds and brains It explains how brains have evolved from our earliest vertebrate ancestors It details how brains provide the basis for successful comprehension of the environment for the formulation of actions and prediction of their consequences and for cooperating or competing with other beings that have brains The book also offers observations regarding such issues as how and why people fall in and out of love the biological basis for experiencing feelings of love and hate and how music and dance have provided the ancestral technology for forming social groups such as tribes and clans The author reviews the history of the mind brain problem and demonstrates how the new sciences of behavioral electrophysiology and nonlinear dynamics combined with the latest computer technology have made it possible for us to observe brains in action He also provides an answer to the question What happens to a stimulus after it enters the brain The answer The stimulus triggers the construction of a percept and is then washed away All that we know is what our brains construct for us by neurodynamics Brains are not logical devices that process information They are dynamical systems that create meaning through interactions with the environment and each other The book shows how the learning process by which brains construct meaning tends to isolate brains into self centered worlds and how nature has provided a remedy first appearing in mammals as a mechanism for pair bonding to ensure reproduction of the young dependent on parents The remedy is based in the neurochemistry of sex which serves to dissolve belief structures in order to open the way for new patterns of understanding and behavior Individuals experience these changes in various ways such as falling in love collegiate indoctrination tribal bonding brain washing political or religious conversions and related types of socialization The highest forms of meaning for humans come through these social attachments

construct for us by neurodynamics Brains are not logical devices that process information They are dynamical systems that create meaning through interactions with the environment and each other The book shows how the learning process by which brains construct meaning tends to isolate brains into self centered worlds and how nature has provided a remedy first appearing in mammals as a mechanism for pair bonding to ensure reproduction of the young dependent on parents The remedy is based in the neurochemistry of sex which serves to dissolve belief structures in order to open the way for new patterns of understanding and behavior Individuals experience these changes in various ways such as falling in love collegiate indoctrination tribal bonding brain washing political or religious conversions and related types of socialization The highest forms of meaning for humans come through these social attachments Societies of brains : a study in the neuroscience of love and hate : the Spinoza lectures, Amsterdam, Netherlands Walter J. how people think about each other Mind Society displays the interdependence of the cognitive and social sciences by describing the interconnections among mental and social mechanisms which interact to generate social changes ranging from marriage patterns to wars Validation comes from detailed studies of important social changes from norms about romantic relationships to economic practices political institutions religious customs and international relations This book belongs to a trio that includes Brain Mind From Neurons to Consciousness and Creativity and Natural Philosophy From Social Brains to Knowledge Reality Morality and Beauty They can be read independently but together they make up a Treatise on Mind and Society that provides a unified and comprehensive treatment of the cognitive sciences social sciences professions and humanities Brain Function and Adaptive Systems A. Harry Klopff, 1972 Brains, Genes, and the Foundations of Human Society Jordan Grafman, Chad E. Forbes, The last 20 years have yielded an explosion of information from the still nascent field of social neuroscience Studies devoted to identifying neural correlates of social cognitive and moral judgment processing have established subcortical and cortical regions that are integral for how we filter and interpret information pertinent to family and friends our social in group and strangers and engage in everything from forming immediate impressions of them to judging their behavior with respect to complex moral norms What is less clear is how neural regions involved in implicit and explicit cognitive processing or those cognitive processes that occur almost instantaneously as opposed to those that are more controlled respectively interact to bias perceptions and behavior Even less is known about how genes and their variants critical for neural function and the structural integrity within neural regions may modulate neural interactions critical for social cognitive and moral judgment processing Recent methodological advancements assessing how different neural regions functionally work together with others and how different genetic variants integral for neural function alter behavior are establishing a more comprehensive view of the implicit and explicit social brain These advancements demonstrate that structures critical for implicit processing e g the amygdala reliably covary in their activity with structures integral for explicit processing e g dorsolateral prefrontal cortex early and often during the processing of social information of varying complexity and in different contexts This suggests that interactions between these regions are necessary to successfully navigate and immediately adapt to one's environment In turn genetic variants like those that comprise the brain derived neurotrophic factor BDNF gene oxytocin receptor gene or serotonin transporter gene likely play an important role in modulating the interaction between and within neural regions integral for interpersonal trust intergroup processes person perception theory of mind i e inferring the thoughts and feelings of others and moral judgment processing The purpose of this Research Topic is to further our understanding of how subcortical and cortical neural regions that vary in their functional contributions to social behavior also depend upon genetic influences in shaping individuals perceptions beliefs attitudes behaviors and how information is attended to and encoded to influence future social behaviors It is particularly important to demonstrate how these regions reliably interact as a function of processing speed i e implicit or

explicit and or context to predict behavior or performance Demonstrating how different genetic factors in turn moderate this interaction or how genetic factors alter a specific region s interaction with other regions is equally important We therefore solicit original empirical work review and opinion papers and methodological papers that can promote our understanding of how interactions between neural regions underlying implicit and explicit processes influence social cognitive and moral judgment processing and are in turn modulated by genetic predispositions This includes work that utilizes fMRI EEG and psychophysiological methodologies lesion samples as well as developmental and computational approaches This Research Topic could serve as an important step in the evolution of our understanding of the complexity of the social mind as well as illuminate the robust effects context has on the way the brain interacts with different stimuli at every level of cognitive processing

Neuroethology of the Colonial Mind: Ecological and Evolutionary Context of Social Brains J. Frances Kamhi, Sara Arganda Carreras, Mathieu Lihoreau, 2023-10-02

Animal groups often display striking collective organization which relies on social interactions These interactions require neural substrates supporting the exchange of information among individuals and the processing of this information The social brain hypothesis suggested from neuroanatomical findings in primates posits that increasing levels of sociality involve a higher investment in neural tissue to cope with social information However distributed cognition and swarm intelligence might alleviate the cognitive load on the individuals and potentially reduce their neural requirements Research on social insects which are an exemplar of collective action has so far produced mixed results Individual cognition and collective action have received a lot of attention and much progress has been done in each of those fields however much less is understood about how the two interact Our goal is to aggregate theoretical and experimental research exploring the links between the complexity of individual and collective behaviors Experimental research testing the social brain hypothesis showed little support for a general explanation across the animal kingdom The relationship between the cognitive abilities of animals and their social interactions are much more complex than previously thought and tackling this problem requires a better knowledge of the fundamental mechanisms underpinning socio cognitive tasks What is the information used by the animals during social interactions How much information is necessary How many neurons and which neural circuits are required for processing this information What neural connections are important Do these social interactions involve memory formation How do the cognitive requirements and neural circuits vary between group members Answering these questions will bring considerable insights into the cognitive complexity involved for social and collective behaviors It will also advance our understanding of inter individual cognitive variability and division of labor in most socially advanced species This Research Topic will be a unique forum for researchers from different fields neurogenetics neuro ethology evolutionary ecology cognitive ecology collective animal behavior computational modeling working on different species to present up to date advances on the physiological correlates of social behavior and delineate future directions for the field of social neuroethology We welcome contributions on any aspect of the cognitive

requirements of social and collective behaviors from molecular cellular and circuit level approaches to how individuals contribute to group action at the behavioral level Specific areas of interest include but are not limited to studies on the neural underpinnings of division of labor neuromodulation or neurogenetics of social behaviors the neural circuits and neuroanatomical basis of group action and how social signals affect learning and behavior We encourage submissions that present original research and review evidence or compare data from multiple species We hope to include work from different disciplines and on a wide range of species including model non model and wild animals with the aim of gaining insight into the patterns of neural investment in individual cognition

Sociocybernetics Rudolf F. Geyer, Johannes van der Zouwen, 2001-01-30 In an effort to shed light on recent developments in sociocybernetic research this volume represents recent and advanced thinking in this rapidly developing field The authors address the core problems in social science caused by increasing societal complexity and analyze the inadequacy of many of the methodological tools still used for grappling with nonlinear self organizing systems Together the 18 contributors propose elements of a new methodology based on sociocybernetic principles aimed at describing and explaining the growth of societal complexity the contribution of autopoiesis of societal subunits to more societal complexity and the new simulation based methodology needed to observe complex social systems This unique volume contributes to a greater understanding of sociocybernetics and its uses as a method for researching modern problems of increasing complexity and interdependence The first part of the book deals with increasing societal complexity and contains chapters on its overall development the complexity of brain environment interaction loops organizational change the development of human values and the increasing interpenetration of societal subsystems The second part concentrates on a current issue in sociocybernetics autopoiesis or self production The chapters included in Part II concentrate on embodied cognition on the applicability of autopoiesis to business firms on its roots in Aristotelian philosophy and on the possibility of societal control and steering in democratic societies Part III more focused on methodology discusses the difficulties inherent in observing complex social systems The chapters deal with the problems of cross cultural comparative research simulation of the evolution of social systems longitudinal simulation of education systems and the methodological difficulties associated with analyzing the unexpected complexities of mutually interacting nonlinear systems
