The Geographic Mosaic Of Coevolution Interspecific Interactions:

The Geographic Mosaic of Coevolution John N. Thompson, 2005-06-15 Coevolution reciprocal evolutionary change in interacting species driven by natural selection is one of the most important ecological and genetic processes organizing the earth's biodiversity most plants and animals require coevolved interactions with other species to survive and reproduce The Geographic Mosaic of Coevolution analyzes how the biology of species provides the raw material for long term coevolution evaluates how local coadaptation forms the basic module of coevolutionary change and explores how the coevolutionary process reshapes locally coevolving interactions across the earth's constantly changing landscapes Picking up where his influential *The Coevolutionary Process* left off John N Thompson synthesizes the state of a rapidly developing science that integrates approaches from evolutionary ecology population genetics phylogeography systematics evolutionary biochemistry and physiology and molecular biology Using models data and hypotheses to develop a complete conceptual framework Thompson also draws on examples from a wide range of taxa and environments illustrating the expanding breadth and depth of research in coevolutionary biology

Conservation Biology Scott P. Carroll, Charles W. Fox, 2008-09-15 The main goal of this book is to encourage and formalize the infusion of evolutionary thinking into mainstream conservation biology It reviews the evolutionary foundations of conservation issues and unifies conceptual and empirical advances in evolutionary conservation biology The book can be used either as a primary textbook or as a supplementary reading in an advanced undergraduate or graduate level course likely to be called Conservation Biology or in some cases Evolutionary Ecology The focus of chapters is on current concepts in evolution as they pertain to conservation and the empirical study of these concepts The balanced treatment avoids exhaustive reviews and overlapping duplication among the chapters Little background in genetics is assumed of the reader

The Coevolutionary Process John N. Thompson, 2009-04-24 Traditional ecological approaches to species evolution have frequently studied too few species relatively small areas and relatively short time spans In *The Coevolutionary Process* John N Thompson advances a new conceptual approach to the evolution of species interactions the geographic mosaic theory of coevolution Thompson demonstrates how an integrated study of life histories genetics and the geographic structure of populations yields a broader understanding of coevolution or the development of reciprocal adaptations and specializations in interdependent species Using examples of species interactions from an enormous range of taxa Thompson examines how and when extreme specialization evolves in interdependent species and how geographic differences in specialization adaptation and the outcomes of interactions shape coevolution Through the geographic mosaic theory Thompson bridges the gap between the study of specialization and coevolution in local communities and the study of broader patterns seen in comparisons of the phylogenies of interacting species

Trait-Mediated Indirect Interactions Takayuki Ohgushi, Oswald Schmitz, Robert D. Holt, 2012-12-06 There is increasing evidence that the structure and functioning of ecological communities and ecosystems are strongly influenced by

flexible traits of individuals within species A deep understanding of how trait flexibility alters direct and indirect species interactions is crucial for addressing key issues in basic and applied ecology This book provides an integrated perspective on the ecological and evolutionary consequences of interactions mediated by flexible species traits across a wide range of systems It is the first volume synthesizing the rapidly expanding research field of trait mediated indirect effects and highlights how the conceptual framework of these effects can aid the understanding of evolutionary processes population dynamics community structure and stability and ecosystem function It not only brings out the importance of this emerging field for basic ecological questions but also explores the implications of trait mediated interactions for the conservation of biodiversity and the response of ecosystems to anthropogenic environmental changes **Encyclopedia of Ecology** Brian D. The Ecology and Evolution of Ant-Plant Interactions Victor Rico-Gray, Paulo S. Oliveira, 2008-09-15 Ants are probably the most dominant insect group on Earth representing ten to fifteen percent of animal biomass in terrestrial ecosystems Flowering plants meanwhile owe their evolutionary success to an array of interspecific interactions such as pollination seed dispersal and herbivory that have helped to shape their great

diversity The Ecology and Evolution of Ant Plant Interactions brings together findings from the scientific literature on the coevolution of ants and plants to provide a better understanding of the unparalleled success of these two remarkable groups of interspecific interactions in general and ultimately of terrestrial biological communities The Ecology and Evolution of Ant Plant Interactions synthesizes the dynamics of ant plant interactions including the sources of variation in their outcomes Victor Rico Gray and Paulo S Oliveira capture both the emerging appreciation of the importance of these interactions within ecosystems and the developing approaches that place studies of these interactions into a broader ecological and evolutionary context The collaboration of two internationally renowned scientists The Ecology and Evolution of Ant Plant Interactions will become a standard reference for understanding the complex interactions between these two taxa

The Ornaments of Life Theodore H. Fleming, W. John Kress, 2013-10-03 The average kilometer of tropical rainforest is teeming with life it contains thousands of species of plants and animals As *The Ornaments of Life* reveals many of the most colorful and eye catching rainforest inhabitants toucans monkeys leaf nosed bats and hummingbirds to name a few are an important component of the infrastructure that supports life in the forest These fruit and nectar eating birds and mammals pollinate the flowers and disperse the seeds of hundreds of tropical plants and unlike temperate communities much of this greenery relies exclusively on animals for reproduction Synthesizing recent research by ecologists and evolutionary biologists Theodore H Fleming and W John Kress demonstrate the tremendous functional and evolutionary importance of these tropical pollinators and frugivores They shed light on how these mutually symbiotic relationships evolved and lay out the current conservation status of these essential species In order to illustrate the striking beauty of these ornaments of the rainforest the authors have included a series of breathtaking color plates and full color graphs and diagrams

Fitness Landscapes and the Origin of Species Sergey Gavrilets, 2018-06-05 The origin of species has fascinated both biologists and the general public since the publication of Darwin's *Origin of Species* in 1859 Significant progress in understanding the process was achieved in the modern synthesis when Theodosius Dobzhansky Ernst Mayr and others reconciled Mendelian genetics with Darwin's natural selection Although evolutionary biologists have developed significant new theory and data about speciation in the years since the modern synthesis this book represents the first systematic attempt to summarize and generalize what mathematical models tell us about the dynamics of speciation *Fitness Landscapes and the Origin of Species* presents both an overview of the forty years of previous theoretical research and the author's new results Sergey Gavrilets uses a unified framework based on the notion of fitness landscapes introduced by Sewall Wright in 1932 generalizing this notion to explore the consequences of the huge dimensionality of fitness landscapes that correspond to biological systems In contrast to previous theoretical work which was based largely on numerical simulations Gavrilets develops simple mathematical models that allow for analytical investigation and clear interpretation in biological terms Covering controversial topics including sympatric speciation and the effects of sexual conflict on speciation this book builds for the first time a general quantitative theory for the origin of species
