SKELETAL SYSTEM

THE FRAMEWORK OF THE HUMAN BODY

Read the text below and then answer the questions.

The skeletal system, or skeleton, is made of bones, cartilage, ligaments, and ligaments. It is one of the most important parts of the human body. Its main function is to support the body and protect the internal organs. It also provides a framework for the muscles and ligaments. The skeleton is made of 206 bones in the adult human body. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Bones, the fundamental building blocks of the skeletal system, are made of a dense, hard material called bone. They are made of a complex of organic and inorganic materials. The organic materials, such as collagen, provide flexibility, while the inorganic materials, such as calcium, provide strength. The combination of these materials makes bones strong and resilient. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Cartilage is a flexible, non-mineral connective tissue that is found in the joints of the skeletal system. It acts as a cushion between the bones, reducing friction and absorbing shock. Cartilage is made of a complex of organic and inorganic materials. The organic materials, such as collagen, provide flexibility, while the inorganic materials, such as calcium, provide strength. The combination of these materials makes cartilage strong and resilient. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Ligaments are strong, fibrous bands of connective tissue that connect the bones to each other. They are made of a complex of organic and inorganic materials. The organic materials, such as collagen, provide flexibility, while the inorganic materials, such as calcium, provide strength. The combination of these materials makes ligaments strong and resilient. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

The skeletal system is not a static entity but rather a dynamic and adaptive one. Throughout life, bones undergo a process called remodeling, where old bone is removed and new bone is formed. This process is regulated by hormones and mechanical stress. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

The skeletal system is a dynamic and interconnected network that adapts to the needs of the body. It is made of a complex of organic and inorganic materials. The organic materials, such as collagen, provide flexibility, while the inorganic materials, such as calcium, provide strength. The combination of these materials makes the skeletal system strong and resilient. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

The skeletal system is a dynamic and interconnected network that adapts to the needs of the body. It is made of a complex of organic and inorganic materials. The organic materials, such as collagen, provide flexibility, while the inorganic materials, such as calcium, provide strength. The combination of these materials makes the skeletal system strong and resilient. The skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

The skeletal system is a dynamic and interconnected network that adapts to the needs of the body. It is made of a complex of organic and inorganic materials.
