The Prevention Of All Cancers:

Prevention of All Cancers Hulda Regehr Clark,2004 Cancer can be cured not just treated Kill the malignancy causing parasite and the tumour causing bacteria Learn the dietary triggers for each oncovirus that immortalises your tumour cells Outwit RAS MYC NEU SRC SV40 JUN and FOS with diet Follow a tester s protocol that guarantees success Get your immunity back with electricity zapping plate zapping and homeography make it easier than ever to find your health again Learn the single epidemiological factor that destroys your immunity Avoid it and live free of rare diseases inherited diseases and cancer Cancer has many contributors but the main actors form a single chain of events Pull out one link and the whole cancer process is blocked This kind of prevention is more powerful than a cure You can get started now for your pets too

The Prevention of Cancer Richard Doll,2017-07-05 Epidemiological studies show that cancer incidence is far more dependent on the conditions of life than previously supposed Classically cancers occurred with heavy exposure to a specific occupational hazard or were associated with habits In some instances research shows the incidence of cancer falls when the method of work or the associated habit is changed In short variation in incidence is now known to be the rule rather than the exception in cancer No cancer that occurs with even moderate frequency occurs everywhere and always to the same extent Sometimes it is even epidemic similar in scale to an epidemic of infectious disease but modified by the fact that the induction period may be as much as thirty years Prevention of cancer is now coming to be regarded as a practicable alternative to its cure We remain almost totally ignorant of how cancer is produced at the cellular level and until we know this our methods of prevention are liable to be cumbersome and inefficient Ethical considerations and the time scale of the disease make it impossible to obtain experimental evidence in man and what action to take has been determined from observing nature s experiments and by analogy from experiments in animals The evidence from epidemiological studies is of particular interest Such studies suggest relationships that would never be thought of in the ordinary course of laboratory work and results that are directly relevant to the problems of human disease The large numbers at risk and the intensity of the medical care to which people with cancer are subjected make it possible to recognize relatively small improvements Such practical decisions based on information thus obtained have largely eliminated the risk of cancer due to occupational hazards in several industries

The Cure and Prevention of All Cancers Hulda Regehr Clark,2010 [Radiation Therapy and the Cancer Center](#) J. M. Vaeth,1973-09-04 **The Prevention of Second Primary Cancers** H. Krueger,D. McLean,D.

Williams,2008-08-12 A second primary cancer SPC is a new primary cancer developing in a person with a history of cancer in a new site or tissue and subsequent to the initial cancer Advances in cancer treatment have led to marked improvements in cancer cure rates over the past 30 years and the control of risk factors has further increased longevity Still cancer survivors are at increased risk not only for recurrence of the primary cancer but also for the development of second primary malignancies the latter being especially true for survivors of childhood cancer SPCs are now more common and research into

them has intensified This monograph provides a synthesis of the current research on SPC culminating in pertinent summary charts covering the whole spectrum of first and second primary cancers and the association between them Readers will gain a general understanding of the epidemiology and of the excess risk of SPCs following an implicated first malignancy The known or suspected etiologic factors for SPCs are identified and the field is further narrowed to those factors that are modifiable in practice Effective preventive measures that might reduce the burden of SPC both for individuals and across at risk populations are presented Providing practical guidance in terms of possibilities and priorities this monograph will be a valuable tool for oncologists general practitioners and health administrators
