- ***Crossing over occur between replicated chromosomes in a diploid species.***
- ***When crossing over takes place between sister chromatids, the process is called sister chromatid exchange(SCE).***

Chromosomes being well defined structures that are easily visible under the optical microscope readily lend themselves to intense physical and biochemical study. The understanding of the structure and function of this most critical genetic material has progressed through a number of interesting stages. Often connected with the development of new techniques in staining and photography using the standard microscope and the electron microscope. It is interesting to look back at the history of cytogenetics. I would like especially to emphasize the work of Karl Sax and many of his students. Work with *Tradescantia* became feasible after Edgar Anderson straightened out the ecology and Sax took advantage of the small number of chromosomes easily visible under the microscope. As a matter of fact this development is seen as the foundation for the quantitative analysis of radiation effects on chromosomes. During the 50 years since then more refined studies have been initiated. The study of cytogenetic mechanisms has become an important tool for the recognition of the effects of environmental factors on all living systems and has made SCE studies possible. One of the most important stages in chromosome research was the development in radiation biology of radiolabeling the chromosome with tritiated thymidine. This technique published in 1957 by Dr      **Sister Chromatid Exchange** Sheldon Wolff, 1982      Alterations of the Sister Chromatid Exchange Frequency in Peripheral Lymphocytes Caused by an Ironman Triathlon Marlies Meisel, 2008-02 Diploma Thesis from the year 2007 in the subject Medicine Human Genetics grade 1.0 University of Vienna Institut für Ernährungswissenschaften 96 entries in the bibliography language English abstract The aim of the present study was to investigate the effect of a triathlon 3.8 km swim 180 km cycle 42.2 km run on the genomic stability of nine highly trained non professional athletes. Therefore the SCE assay a relevant biological response marker for genotoxicity in human biomonitoring studies. PENDZICH et al 1997 was performed using peripheral lymphocytes on account of their effortless accessibility. WILKOSCY and RYNARD 1990 Duplicate lymphocyte cell cultures of each participant were incubated for 72 h 37 °C 5% CO<sub>2</sub> according to a short term human lymphocyte cell culture. For each participant at least 50 metaphases containing 43-46 chromosomes were scored to evaluate the mean SCE frequency. The number of SCEs per cell was calculated to a chromosome set of a normal diploid human cell containing 46 chromosomes. In the present study the alteration of SCE frequency 48 h pre and 24 h post race was evaluated. As an additional endpoint Top 5 HFCs highest five absolute SCE means were assayed. It could be demonstrated that both the total mean SCE frequency and the mean Top 5 HFC frequency on 24 h post race were significantly decreased. p      *Sister chromatid exchanges* Raymond R.
