Theory of the Spread of Epidemics and Movement Ecology of Animals V. M. (Nitant) Kenkre, Luca Giuggioli, 2021-01-28 Exploiting powerful techniques from physics and mathematics this book studies animal movement in ecology with a focus on epidemic spread Pulmonary syndrome is not only feared in epidemics of recent times such as COVID 19 but is also characteristic of epidemics studied earlier such as Hantavirus The Hantavirus is one of the book s central topics Correlations between epidemic outbreaks and precipitation events like El Ni o are analyzed and spatial reservoirs of infection in off period of the epidemic known as refugia are studied Predicted traveling waves of infection are successfully compared to field observations Territoriality in scent marking animals is presented with parallels drawn with the theory of melting The flocking and herding of birds and mammals are described in terms of collective excitations For scientists interested in movement ecology and epidemic spread this book provides effective solutions to long standing problems

Solid-State Chemistry of Inorganic Materials III: Volume 658 Margret J. Geselbracht, John E. Greedan, David C. Johnson, M. A. Subramanian, 2001-11-07 Solid state chemistry is an interdisciplinary field and these researchers share the common challenge of understanding controlling and predicting the structures and properties of solids at the atomic level This book provides a forum for the presentation of recent advances in the solid state chemistry of inorganic materials and the impact of these advances on the development of practical applications Topics include crystal chemistry of complex systems dielectrics crystal chemistry glasses and electrical transport transport properties metal insulator systems magnetism and manganates new materials meso nanoporous materials micro meso nanoporous materials inorganic organic hybrids synthesis new methods and new materials solid state ionics battery materials thermopower and optical materials solid state ionics battery materials and energy storage and

Memory Functions, Projection Operators, and the Defect Technique V. M. (Nitant) Kenkre, 2021-04-13 This book provides a graduate level introduction to three powerful and closely related techniques in condensed matter physics memory functions projection operators and the defect technique Memory functions appear in the formalism of the generalized master equations that express the time evolution of probabilities via equations non local in time projection operators allow the extraction of parts of quantities such as the diagonal parts of density matrices in statistical mechanics and the defect technique allows solution of transport equations in which the translational invariance is broken in small regions such as when crystals are doped with impurities These three methods combined form an immensely useful toolkit for investigations in such disparate areas of physics as excitation in molecular crystals sensitized luminescence charge transport non equilibrium statistical physics vibrational relaxation granular materials NMR and even theoretical ecology This book explains the three techniques and their interrelated nature along with plenty of illustrative examples Graduate students beginning to embark on a research project in condensed matter physics will find this book to be a most fruitful source of theoretical training

Multiple Impacts in Dissipative Granular Chains Ngoc Son Nguyen, Bernard Brogliato, 2013-07-06 The extension of collision models for single impacts between two bodies to the case of multiple impacts which take place when several collisions occur at the same time in a multibody system is a challenge in Solid Mechanics due to the complexity of such phenomena even in the frictionless case This monograph aims at presenting the main multiple collision rules proposed in the literature Such collisions typically occur in granular materials the simplest of which are made of chains of aligned balls These chains are used throughout the

book to analyze various multiple impact rules which extend the classical Newton kinematic restitution Poisson kinetic restitution and Darboux Keller energetic or kinetic restitution approaches for impact modelling The shock dynamics in various types of chains of aligned balls monodisperse tapered decorated stepped chains is carefully studied and shown to depend on several parameters restitution coefficients contact stiffness ratios elasticity coefficients linear or nonlinear force indentation relation and kinetic angles that depend on the mass ratios The dissipation and the dispersion of kinetic energy during a multiple impact are mandatory modelling and are quantified with suitable indices Particular attention is paid to the ability of the presented laws to correctly predict the wave effects in the chains Comparisons between many numerical and experimental results are shown as well as comparisons between four different impact laws in terms of their respective abilities to correctly model dissipation and dispersion of energy
