Molecular Biology and Evolution of Blood Group and MHC Antigens in Primates Antoine Blancher,Jan Klein,Wladyslaw W. Socha,2012-12-06 Zoologists have categorized primates into a single order and no one doubts today that they share a common ancestry Humans and Old and New World non human primate species from the lemurs of Madagascar to the African anthropoid apes represent diverging branches of an evolutionary common trunk Along with species specific characters all primates have retained a number of ancestral traits relics of their common origin The comparative study of these species specific and ancestral traits makes it possible to reconstruct the evolutionary pathways of humans and nonhuman primates The discovery of the human blood groups and later of the Major Histocompatibility Complex MHC had a seminal effect on the field of human genetics providing the first sound examples of Mendelian polymorphisms The use of blood group and MHC alleles as genetic markers in biological anthropology generated a conceptual revolution and persuaded researchers to begin to think in terms of populations and not only in terms of typology The counterparts of these human red and white cell antigens were found and studied in nonhuman primates and progress in this field is summarized in this book

The cover of this book depicts a Lamassu, one of the fabulous beasts of mythology. Like many similar creatures such as the Chimera, Griffon, Hippocamp, and Cockatrice, the body of the Lamassu was clearly a combination of structures derived from several different species. In other words, it provides a highly successful example of xenotransplantation. But in selecting a symbol of xenotransplantation to grace the cover of this volume, why choose the Lamassu in preference to the other ancient beasts? The reason is that the Lamassu appears to have been endowed with a much Fig 1. Homer described the Chimera as consisting of a lion's foreparts, a goat in the middle, and a serpent's hind parts. VIII. Foreword. Fig 2. The Griffon had the foreparts of an eagle and the rear tail and hindlegs of a lion. Its eagle-like head had pointed upstanding ears like those of an ass. Feathers grew upon its head, neck, and chest, and the rest of its body was covered in leonine fur, more benign and desirable character than many of its mythological associates. For example, reliable reports state that the Chimera (Fig 1) hitherto the animal most commonly selected to symbolize xenografting killed everyone who came within range of its fiery breath. Perhaps not surprisingly, therefore, the Chimera is variously described as one of the largest monsters ever born, a savage creature, and a symbol of complex evil. **National Library of Medicine Audiovisuals Catalog** National Library of Medicine (U.S.),
