

Distinguish between Design of experiment and sample survey:-

In design of experiment, the enquiries can be answered by conducting an experiment, suitably designed or controlled by the experimenter. Thus, if we want to know which five given varieties of rice is expected to give the maximum yield, we have to conduct an experiment with a sample of experimental plots, and suitably controlled, and we can then base our conclusions upon the experimental data.

In sample survey technique, the enquiries can be answered by conducting a survey based on samples. Here the individuals to be sampled occur in nature and can't be subjected to any experimental control. Members are sampled as they appear in nature and required information obtained from them.

Statistic, Sampling distribution and Standard Error:-

Statistic is a function of sample values which is itself an observable random variable which does not contain any parameter.

The probability distribution of any statistic is known as sampling distribution.

The standard deviation of the sampling distribution of a statistic is known as standard error. [C.U. 2008]

Remark on the Utility of standard Error:- [C.U. 2008]
Standard Error plays a very important role in the large sample theory and forms the basis of the testing of hypothesis. If T is any statistic, then for large samples,

$$Z = \frac{T - E(T)}{\sqrt{V(T)}} \sim N(0,1)$$

$$\Rightarrow Z = \frac{T - E(T)}{S.E.(T)} \sim N(0,1)$$

Thus if the discrepancy between the observed and expected (hypothetical) value of a statistic is greater than 1.96 times the S.E., the hypothesis is rejected at 5% level of significance. Similarly, if $|T - E(T)| \leq 1.96 \times S.E.(T)$, the deviation is not regarded significant at 5% level of significance.

The magnitude of standard error gives an index of the precision of the estimate of the parameter. The reciprocal of the standard error is taken as the measure of reliability or precision of the sample.
