Taste & Smell

Taste & smell

Most of our special senses are chemoreception systems: gustation (taste) and olfaction (smell). The degree to which we can respond to taste or olfaction, thereby, and smell is largely determined by our environment. In fact, olfaction, thereby, and smell is largely determined by our environment. Concentrations

Taste receptors vary depending on the concentration of the substance in a given solution or solid. For low concentrations, taste is sweet and salty; moderate concentrations are sour and bitter; and high concentrations are very sweet and very salty.

Gustation

Gustation, the sense of taste, gives us information about the food and drink that we consume. Taste buds on the primary gustatory organ, the tongue, contain chemoreceptors called gustatory cells. These taste buds have four basic components: sweet, sour, bitter and salty. A fifth taste, umami, or savory, has been reported. This flavor is associated with umami, or the aged-flavor of meat broth.

The taste bud

Essentially, substances that produce taste 'bind' with receptor molecules on the surface of the microvilli. The resulting receptor potential travels to the basal end of the gustatory cell, where the signal is chemically transmitted to the supporting cell via molecular messengers. Gustatory cells live about 10 days, after which they are replaced by new cells generated from basal cells at the base of the taste buds.

Compound sweet and salty tastes, we are left with sour tastes, which are bitter compounds, and about 1,000-1,500 taste buds are present on the tongue. The taste buds are located on the tongue, and the taste buds are located on the tongue. The taste buds are located on the tongue, and the taste buds are located on the tongue.

Olfaction

The sense of smell is called olfaction, or the detection of odors. Olfaction depends on specialized chemical receptors, or chemoreceptors, located within the olfactory epithelium. These receptors are designed to respond to small amounts of an odorant, a molecule that can be smelled. The brain integrates the input from several different receptors to identify a particular odor. Humans can detect about 10,000 odors.

As air flows through the nose, the odors across the nasal cavity pass over the olfactory epithelium. Incoming odorant molecules can interact with the olfactory neurons, leading to the ability to detect odors by increasing the release of an impulse, which can activate the neurons of the brain.

Olfactory receptors in the nasal cavity are located in the olfactory epithelium. The olfactory epithelium is a specialized tissue in the nasal cavity. The olfactory epithelium is a specialized tissue in the nasal cavity. The olfactory epithelium is a specialized tissue in the nasal cavity.

The synapse

Neurons communicate with other cells at a synapse, the site of a nerve impulse transmission. The space between the presynaptic, or sending, neuron and the postsynaptic, or receiving, cell is called the synaptic cleft. An impulse enters at the tip of the axon, the terminal button, where 'messenger' molecules called neurotransmitters. These highly specialized chemicals carry nerve impulses from the presynaptic cell to the postsynaptic cell, where they bind to receptors on the postsynaptic cell, which then activate the postsynaptic cell.
