Abstract: Both cardiovascular disease (CVD) and social health carry high health and economic burdens. We undertook a systematic review to investigate the association between social isolation, low social support, and loneliness with health service utilisation and survival after a CVD event among people living in Australia and New Zealand. Four electronic databases were systematically searched for the period before June 2020. Two reviewers undertook the title/abstract screen. One reviewer undertook a full-text screen and data extraction. A second author checked data extraction. Of 756 records, 25 papers met our inclusion criteria. Included studies recruited 10–12,821 participants, aged 18–98 years, and the majority were males. Greater social support was consistently associated with better outcomes on four of the five themes (discharge destination, outpatient rehabilitation attendance, rehospitalisation and survival outcomes; no papers assessed the length of inpatient stay). Positive social health was consistently associated with better discharge designation to higher independent living. As partner status and living status did not align with social isolation and social support findings in this review, we recommend they not be used as social health proxies. Our systematic review demonstrates that social health is considered in cardiac care decisions and plays a role in how healthcare is being delivered (i.e., outpatient, rehabilitation, or nursing home). This likely contributes to our finding that lower social support is associated with high-intensity healthcare services, lower outpatient rehabilitation attendance, greater rehospitalisation and poorer survival. Given our evidence, the first step to improve cardiac outcomes is acknowledging that social health is part of the decision-making process. Incorporating a formal assessment of social support into healthcare management plans will likely improve cardiac outcomes and survival. Further research is required to assess if support person/s need to engage in the risk reduction behaviours themselves for outpatient rehabilitation to be effective. Further synthesis of the impact of social isolation and loneliness on health service utilisation and survival after a CVD event is required.

1. Introduction

Cardiovascular disease (CVD) is the leading cause of death globally [1] and carries a high economic burden, which is driven largely by productivity and direct healthcare costs [2,3]. It is essential to identify factors that influence health service utilisation and subsequent CVD events, to mitigate the significant health and economic burden of CVD. Poor social health is a modifiable risk factor for CVD [4] and mortality [5] and also carries a high health and economic burden. Social health refers to a person's ability to form fulfilling, meaningful relationships; a person's ability to adapt in social situations; and support from other people, institutions, and services. The concepts of social isolation, loneliness, and social support are often discussed in relation to social health. How these concepts are defined

Sourcebook of Social Support and Personality Gregory R. Pierce,Brian Lakey,I.G. Sarason,2013-11-11 The work of 47 contributors from the U S Canada and Israel the Sourcebook gives special attention to

the complexity of the social support construct expanding the field's theoretical base by seriously reappraising social support research in the context of findings from other fields of psychology and related disciplines. Personality processes are specified to account for observed associations between social support and physical well-being. Several new studies are included which illustrate empirical approaches to exploring these processes. And key contributions highlight the great strides made in understanding the links among personal dispositions, situational contexts, and potentially supportive transactions.

Epidemiology and Prevention of Cardiovascular Diseases Darwin Labarthe, 2011. Epidemiology and Prevention of Cardiovascular Disease: A Global Challenge, Second Edition provides an in-depth examination of epidemiologic research and prevention measures for the full range of cardiovascular diseases (CVD). This authoritative text on the world's leading causes of death describes in detail the nature of atherosclerotic and hypertensive diseases, including their determinants, prevention, and control, as well as policies for intervention in community and clinical settings. This Second Edition is fully updated, more extensively referenced, and expanded to include new information about the public health dimensions of CVD prevention, exploring the basis of public health decisions and the process by which decision-making bodies develop guidelines and recommendations. Epidemiology and Prevention of Cardiovascular Diseases: A Global Challenge, Second Edition is the essential text for any student or practitioner concerned with global cardiovascular health. **Handbook of Health**

Psychology Andrew Baum, Tracey A. Revenson, Jerome E. Singer, 2012. This model has been expanded across several levels of analysis, including cultural, macro-social, and cellular factors. The 2nd edition also features greater emphasis on translating research into practice and policy. Two new sections on risk and protective factors for disease and another on social and structural influences that affect health, such as socioeconomic status, reflect the current scholarship in the field. More on prevention and/or interventions and treatment in the applications section. The book opens with the field's central theories, including a newer stress theory that emphasizes the interaction of biological and social systems. Part 2 reviews the mechanisms that help us explain the link between health and behavior across diseases and populations. The all-new Part 3 focuses on variables that lead to the onset and progression of major diseases or that are instrumental in promoting health.
