The Future of Piagetian Theory L. Butler,L.C.R.

Restaino-Baumann,V.L. Shulman,2012-12-06 Until recently most books and articles on Piaget s theory whether laudatory or critical were written by psychologists or more rarely epistemologists who had had no direct contact with the research that provided the basis for the theoretical constructs nor with the ongoing work on the theory itself These authors who looked into the theory so to speak from the outside often noted aspects that were less visible to those working inside the theory and in this way raised a number of important questions However because most of these authors were psychologists they often overlooked the main thrust of Piaget s work which is epistemological Many complained about a gap between the theory and the experimental data as reported Such criticism may be justified at least in part if the theory is taken to be a psychological theory But Piaget himself always emphasized his epistemological orientation with this in view the methodology of the research and its links to the conceptual framework of the theory appear in a different guise The value of a given methodology depends on its contribution to the theory for which it was designed The gap between theory and experiment that was frequently criticized is in fact the gap between the psychological and the epistemic subject

Development of executive function during childhood Yusuke Moriguchi,Philip D Zelazo,Nicolas Chevalier,2016-04-01

Executive function refers to the goal oriented regulation of one s own thoughts actions and emotions Its importance is attested by its contribution to the development of other cognitive skills e g theory of mind social abilities e g peer interactions and academic achievement e g mathematics and by the consequences of deficits in executive function which are observed in wide range of developmental disorders such as attention deficit hyperactivity disorder and autism Over the last decade there have been growing interest in the development of executive function and an expanding body of research has shown that executive function develops rapidly during the preschool years with adult level performance being achieved during adolescence or later This recent work together with experimental research showing the effects of interventions targeting executive function has yielded important insights into the neurocognitive processes underlying executive function Given the complexity of the construct of executive function however and the multiplicity of underlying processes there are often inconsistencies in the way that executive function is defined and studied This inconsistency has hampered communication among researchers from various fields This Research Topic is intended to bridge this gap and provide an opportunity for researchers from different perspectives to

discuss recent advances in understanding childhood executive function Researchers using various methods including behavioral experiments neuroimaging eye tracking computer simulation observational methods and questionnaires are encouraged to contribute original empirical research In addition to original empirical articles theoretical reviews and opinions perspective articles on promising future directions are welcome We hope that researchers from different areas such as developmental psychology educational psychology experimental psychology neuropsychology neuroscience psychiatry computational science etc will be represented in the Research Topic
