Advancing Research in Information and Communication Technology Michael Goedicke, Erich Neuhold, Kai Rannenber, 2021-08-03 For 60 years the International Federation for Information Processing IFIP has been advancing research in Information and Communication Technology ICT This book looks into both past experiences and future perspectives using the core of IFIP's competence its Technical Committees TCs and Working Groups WGs Soon after IFIP was founded it established TCs and related WGs to foster the exchange and development of the scientific and technical aspects of information processing IFIP TCs are as diverse as the different aspects of information processing but they share the following aims To establish and maintain liaison with national and international organizations with allied interests and to foster cooperative action collaborative research and information exchange To identify subjects and priorities for research to stimulate theoretical work on fundamental issues and to foster fundamental research which will underpin future development To provide a forum for professionals with a view to promoting the study collection exchange and dissemination of ideas information and research findings and thereby to promote the state of the art To seek and use the most effective ways of disseminating information about IFIP's work including the organization of conferences workshops and symposia and the timely production of relevant publications To have special regard for the needs of developing countries and to seek practicable ways of working with them To encourage communication and to promote interaction between users practitioners and researchers To foster interdisciplinary work and in particular to collaborate with other Technical Committees and Working Groups The 17 contributions in this book describe the scientific technical and further work in TCs and WGs and in many cases also assess the future consequences of the work's results These contributions explore the developments of IFIP and the ICT profession now and over the next 60 years The contributions are arranged per TC and conclude with the chapter on the IFIP code of ethics and conduct

Semi-Infinite Programming Miguel Ángel Goberna, Marco A. López, 2013-11-11 Semi infinite programming SIP deals with optimization problems in which either the number of decision variables or the number of constraints is finite This book presents the state of the art in SIP in a suggestive way bringing the powerful SIP tools close to the potential users in different scientific and technological fields The volume is divided into four parts Part I reviews the first decade of SIP 1962-1972 Part II analyses convex and generalised SIP conic linear programming and disjunctive programming New numerical methods for linear convex and continuously differentiable SIP problems are proposed in Part III Finally Part IV provides an overview of the applications of SIP to probability statistics experimental design robotics optimization under uncertainty production games and separation problems Audience This book is an indispensable reference and source for advanced students and researchers in applied mathematics and engineering

Stochastic Optimization Kurt Marti, 2012-12-06 This volume includes a selection of refereed papers presented at the GAMM IFIP Workshop on Stochastic Optimization Numerical Methods and Technical Applications held at the Federal Armed

Forces University Munich May 29 31 1990 The objective of this meeting was to bring together scientists from Stochastic Programming and from those Engineering areas where Mathematical Programming models are common tools as e g Optimal Structural Design Power Dispatch Acid Rain Management etc The first theoretical part includes the papers by S D Flam H Niederreiter E Poechinger and R Schultz The second part on methods and applications contains the articles by N Baba N Grwe and W Roemisch J Mayer E A Mc Bean and A Vasarhelyi

Complex System Modelling and Control Through Intelligent Soft Computations Quanmin Zhu,Ahmad Taher Azar,2014-11-29 The book offers a snapshot of the theories and applications of soft computing in the area of complex systems modeling and control It presents the most important findings discussed during the 5th International Conference on Modelling Identification and Control held in Cairo from August 31 September 2 2013 The book consists of twenty nine selected contributions which have been thoroughly reviewed and extended before their inclusion in the volume The different chapters written by active researchers in the field report on both current theories and important applications of soft computing Besides providing the readers with soft computing fundamentals and soft computing based inductive methodologies algorithms the book also discusses key industrial soft computing applications as well as multidisciplinary solutions developed for a variety of purposes like windup control waste management security issues biomedical applications and many others It is a perfect reference guide for graduate students researchers and practitioners in the area of soft computing systems modeling and control

Stability and Boundary Stabilization of 1-D Hyperbolic Systems Georges Bastin,Jean-Michel Coron,2016-07-26 This monograph explores the modeling of conservation and balance laws of one dimensional hyperbolic systems using partial differential equations It presents typical examples of hyperbolic systems for a wide range of physical engineering applications allowing readers to understand the concepts in whichever setting is most familiar to them With these examples it also illustrates how control boundary conditions may be defined for the most commonly used control devices The authors begin with the simple case of systems of two linear conservation laws and then consider the stability of systems under more general boundary conditions that may be differential nonlinear or switching They then extend their discussion to the case of nonlinear conservation laws and demonstrate the use of Lyapunov functions in this type of analysis Systems of balance laws are considered next starting with the linear variety before they move on to more general cases of nonlinear ones They go on to show how the problem of boundary stabilization of systems of two balance laws by both full state and dynamic output feedback in observer controller form is solved by using a backstepping method in which the gains of the feedback laws are solutions of an associated system of linear hyperbolic PDEs The final chapter presents a case study on the control of navigable rivers to emphasize the main technological features that may occur in real live applications of boundary feedback control

Stability and Boundary Stabilization of 1 D Hyperbolic Systems will be of interest to graduate students and researchers in applied mathematics and control engineering The wide range of applications it discusses will help it to have as broad an appeal within these groups as

possible *Optimal Control Theory* Suresh P. Sethi, 2018-11-28 This fully revised 3rd edition offers an introduction to optimal control theory and its diverse applications in management science and economics It brings to students the concept of the maximum principle in continuous as well as discrete time by using dynamic programming and Kuhn Tucker theory While some mathematical background is needed the emphasis of the book is not on mathematical rigor but on modeling realistic situations faced in business and economics The book exploits optimal control theory to the functional areas of management including finance production and marketing and to economics of growth and of natural resources In addition this new edition features materials on stochastic Nash and Stackelberg differential games and an adverse selection model in the principal agent framework The book provides exercises for each chapter and answers to selected exercises to help deepen the understanding of the material presented Also included are appendices comprised of supplementary material on the solution of differential equations the calculus of variations and its relationships to the maximum principle and special topics including the Kalman filter certainty equivalence singular control a global saddle point theorem Sethi Skiba points and distributed parameter systems Optimal control methods are used to determine optimal ways to control a dynamic system The theoretical work in this field serves as a foundation for the book which the author has applied to business management problems developed from his research and classroom instruction The new edition has been completely refined and brought up to date Ultimately this should continue to be a valuable resource for graduate courses on applied optimal control theory but also for financial and industrial engineers economists and operational researchers concerned with the application of dynamic optimization in their fields **Developments in Model-Based Optimization and Control** Sorin Olaru, Alexandra

Grancharova, Fernando Lobo Pereira, 2015-12-23 This book deals with optimization methods as tools for decision making and control in the presence of model uncertainty It is oriented to the use of these tools in engineering specifically in automatic control design with all its components analysis of dynamical systems identification problems and feedback control design *Developments in Model Based Optimization and Control* takes advantage of optimization based formulations for such classical feedback design objectives as stability performance and feasibility afforded by the established body of results and methodologies constituting optimal control theory It makes particular use of the popular formulation known as predictive control or receding horizon optimization The individual contributions in this volume are wide ranging in subject matter but coordinated within a five part structure covering material on complexity and structure in model predictive control MPC collaborative MPC distributed MPC optimization based analysis and design and applications to bioprocesses multivehicle systems or energy management The various contributions cover a subject spectrum including inverse optimality and more modern decentralized and cooperative formulations of receding horizon optimal control Readers will find fourteen chapters dedicated to optimization based tools for robustness analysis and decision making in relation to feedback mechanisms fault detection for example and three chapters putting forward applications where the model based optimization brings a novel

perspective Developments in Model Based Optimization and Control is a selection of contributions expanded and updated from the Optimisation based Control and Estimation workshops held in November 2013 and November 2014 It forms a useful resource for academic researchers and graduate students interested in the state of the art in predictive control Control engineers working in model based optimization and control particularly in its bioprocess applications will also find this collection instructive

Optimization and Discrete Choice in Urban Systems Bruce G. Hutchinson, Peter Nijkamp, Michael Batty, 2012-12-06 The papers contained in this volume were originally presented at the International symposium on New Directions in Urban Systems Modelling held at the University of Waterloo in July 1983 The papers have been reviewed and rewritten since that time The exception is the introductory paper written specially by Manfred Fischer and Peter Nijkamp as an introduction to this volume The manuscript was prepared in the word processing unit in the department of Civil Engineering university of Waterloo The sustained work of Mrs I Steffler in preparing this manuscript is gratefully acknowledged R K Kumar provided excellent assistance with the editorial process The symposium and the preparation of this manuscript were supported financially by the Natural Sciences and Engineering Research Council of Canada The Academic Development Fund and the Department of Civil Engineering University of Waterloo

Convexity and Duality in Optimization Jacob Ponstein, 2012-12-06 The analysis and optimization of convex functions have received a great deal of attention during the last two decades If we had to choose two key words from these developments we would retain the concept of subdifferential and the duality theory As it is usual in the development of mathematical theories people had since tried to extend the known definitions and properties to new classes of functions including the convex ones For what concerns the generalization of the notion of subdifferential tremendous achievements have been carried out in the past decade and any mathematician who is faced with a nondifferentiable nonconvex function has now a panoply of generalized subdifferentials or derivatives at his disposal A lot remains to be done in this area especially concerning vector valued functions however we think the golden age for these researches is behind us Duality theory has also fascinated many mathematicians since the underlying mathematical framework has been laid down in the context of Convex Analysis The various duality schemes which have emerged in the recent years despite of their mathematical elegance have not always proved as powerful as expected
