Okken, Jochim Koch, 2012-12-06 Over the past 15 years the population of sick neonates has changed The average birthweight has decreased dramatically to as low as 450g while gestational age has been reduced to 22 21 weeks These babies have totally different needs and require more complex health care It is now time to change previous recommendations which were based on more mature neonates In this foreword we aim to give some of the background into the ideas which lead to us starting work on new guidelines The question was Can the thermal condition of the baby be better monitored and investigated and if so how Measurement of body temperature remains a very important method of ascertaining the thermal condition of a newborn baby There is an implicit international agreement that the body temperature of an infant is measured either intermittently using a liquid expansion thermometer or continuously by means of temperature sensors placed in the rectum or the axilla Rectal temperature is not necessarily identical to the core temperature There may be up to a 2 C difference and this could result in an incorrect assessment of the condition of the patient For example in the presence of cold lower limbs the cool venous blood returning from the legs will flow close to the rectum and as a result the rectal temperature may be significantly lower than that of the core Other workers have shown how rectal temperature depends on the depth to which the sensor has been inserted     Physiological And Biochemical Basis For Perinatal Medicine A. Minkowski, M.

**Triglycerides and Cholesterol Research** Linda T. Welson, 2006 Triglycerides are the chemical form in which most fat exists in food as well as in the body They are also present in blood plasma and in association with cholesterol form the plasma lipids Triglycerides in plasma are derived from fats eaten in foods or made in the body from other energy sources like carbohydrates Calories ingested in a meal and not used immediately by tissues are converted to triglycerides and transported to fat cells to be stored Hormones regulate the release of triglycerides from fat tissue so they meet the body's needs for energy between meals Cholesterol is a soft waxy substance found among the lipids fats in the bloodstream and in all the body's cells It's an important part of a healthy body because it's used to form cell membranes some hormones and is needed for other functions But a high level of cholesterol in the blood hypercholesterolemia is a major risk factor for coronary heart disease which leads to heart attack Cholesterol and other fats can't dissolve in the blood They have to be transported to and from the cells by special carriers called lipoproteins This book presents leading new research from around the world
