

The Nervous System

The nervous system

The nervous system is composed of two integrated subdivisions: an extensive peripheral nervous system, which extends throughout the body, and a central nervous system, which is located in the head and spine.

The CNS includes the brain and spinal cord, which are covered by protective meninges called the leptomeninges (pia mater, arachnoid mater, and dura mater). The brain is the central control center, and the spinal cord is the main communication pathway between the brain and the rest of the body.

The peripheral nervous system (PNS) includes all the nerves and ganglia outside the brain and spinal cord. It is responsible for transmitting information between the CNS and the rest of the body.

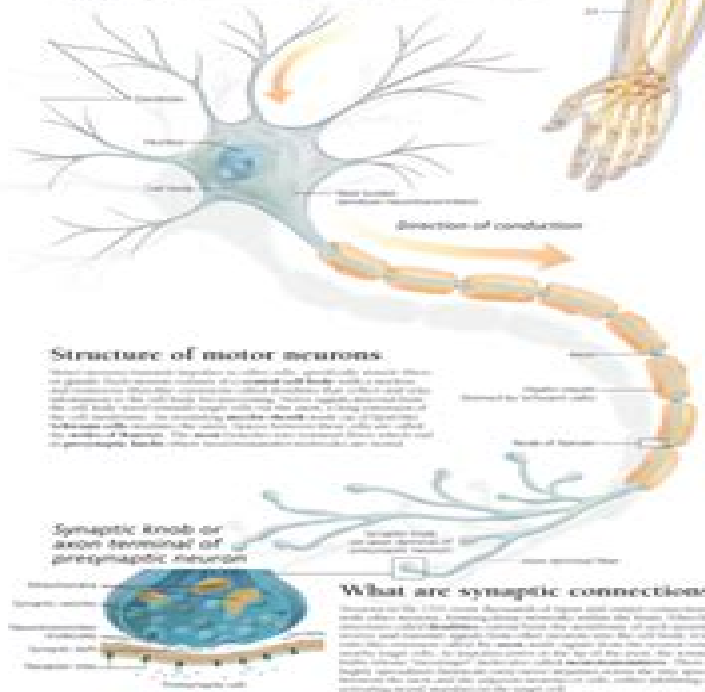

The nervous system is divided into two main parts: the central nervous system (CNS) and the peripheral nervous system (PNS). The CNS is located in the head and spine, and the PNS is located throughout the rest of the body.

Spinal cord

The spinal cord and nerves

The spinal cord is a long, thin, tube-shaped structure that runs from the base of the brain down to the lower back. It is the central part of the CNS and is responsible for transmitting information between the brain and the rest of the body. The spinal cord is composed of 31 segments, each of which is connected to a pair of spinal nerves. The spinal nerves are responsible for carrying information between the spinal cord and the rest of the body.

Synaptic knob or axon terminal of presynaptic neuron

What are synaptic connections?

At the end of the CNS, the axons of many neurons terminate in a structure called a synaptic knob or axon terminal. These terminals are located at the end of the axon and are responsible for transmitting information between the neuron and the rest of the body. The synaptic knob is a small, oval-shaped structure that contains a number of small vesicles called synaptic vesicles. These vesicles contain neurotransmitters, which are released into the synaptic cleft when the neuron is activated. The neurotransmitters then bind to receptors on the cell membrane of the target cell, which causes the target cell to become active.

The brain

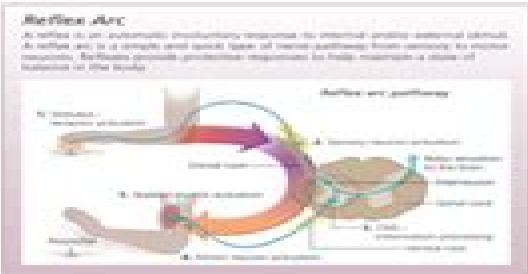

The brain is the central control center of the nervous system. It is a large, complex organ that is responsible for processing information from the rest of the body and controlling the body's responses. The brain is composed of three main parts: the cerebrum, the cerebellum, and the brainstem. The cerebrum is the largest part of the brain and is responsible for most of the brain's functions, including thinking, feeling, and controlling the body's movements. The cerebellum is a smaller part of the brain that is located at the back of the head and is responsible for coordinating movement and balance. The brainstem is the part of the brain that connects the cerebrum and cerebellum to the spinal cord and is responsible for controlling basic life functions, such as breathing and heart rate.
