Synthesis Techniques And Optimizations For Reconfigurable Systems:

Synthesis Techniques and Optimizations for Reconfigurable Systems Ryan Kastner, Adam Kaplan, Majid Sarrafzadeh, 2003-10-27 Synthesis Techniques and Optimization for Reconfigurable Systems discusses methods used to model reconfigurable applications at the system level many of which could be incorporated directly into modern compilers. The book also discusses a framework for reconfigurable system synthesis which bridges the gap between application level compiler analysis and high level device synthesis. The development of this framework discussed in Chapter 5 and the creation of application analysis which further optimize its output discussed in Chapters 7, 8 and 9 represent over four years of rigorous investigation within UCLA's Embedded and Reconfigurable Laboratory ERLab and UCSB's Extensible Programmable and Reconfigurable Embedded Systems EXPRESS Group. The research of these systems has not yet matured and we continually strive to develop data and methods which will extend the collective understanding of reconfigurable system synthesis.

Synthesis Techniques and Optimizations for Reconfigurable Systems Ryan Kastner, 2002 [Introduction to Reconfigurable Computing](#) Christophe Bobda, 2007-09-30 Introduction in Reconfigurable Computing provides a comprehensive study of the field Reconfigurable Computing. It provides an entry point to the novice willing to move in the research field reconfigurable computing, FPGA and system on programmable chip design. The book can also be used as teaching reference for a graduate course in computer engineering or as reference to advance electrical and computer engineers. It provides a very strong theoretical and practical background to the field of reconfigurable computing from the early Estrin's machine to the very modern architecture like coarse grained reconfigurable device and the embedded logic devices. Apart from the introduction and the conclusion the main chapter of the book are the following: Architecture of reconfigurable systems which presents the technology and the architecture used in fine grained and those used in coarse grained reconfigurable devices; Design and implementation. This section deals with the implementation on reconfigurable system. It briefly covers the steps needed to implement application on today's FPGAs and focus on the logic synthesis for FPGA in particular LUT technology mapping. High Level Synthesis for Reconfigurable Devices. The high level synthesis for reconfigurable systems also known as temporal partitioning is presented here. Several temporal partitioning techniques are presented and explained. Temporal placement. This section considers stand alone reconfigurable systems. It assumes that a kind of operating systems for reconfigurable systems is in charge of managing the resources of a given system and allocate space on a device for the computation of incoming tasks and therefore presents several temporal placement approaches for off line as well as on line placement. On line and Dynamic Interconnection. This chapter reviews and explains the different approaches for allowing communication between modules dynamically placed at run time on a given device. Designing a reconfigurable application on Xilinx Virtex FPGA. In this section the different design approaches of partial reconfigurable systems on the Xilinx FPGAs that are one of the few one on the market with this feature is explained. System on

programmable chip System on programmable chip is a hot topic in reconfigurable computing This is mainly the integration of a system made upon some peripheral UART Ethernet VGA etc but also computational Coding filter etc hardware modules on one programmable chip The current usable solutions are presented The book furthermore focusses on the development of adaptive multiprocessors on chip i e systems consisting of a set of Processors and exchangeable hardware accelerators Applications This part covers the use of reconfigurable system in computer architecture rapid prototyping reconfigurable supercomputer reconfigurable massively parallel computers and algorithm better adapted for reconfigurable systems distributed arithmetic network packet processing etc

Dynamic Reconfigurable Architectures and Transparent Optimization Techniques Antonio Carlos Schneider Beck Fl., Luigi Carro, 2010-03-10 Dynamic Reconfigurable Architectures and Transparent Optimization Techniques presents a detailed study on new techniques to cope with the aforementioned limitations First characteristics of

reconfigurable systems are discussed in details and a large number of case studies is shown Then a detailed analysis of several benchmarks demonstrates that such architectures need to attack a diverse range of applications with very different behaviours besides supporting code compatibility This requires the use of dynamic optimization techniques such as Binary Translation and Trace reuse Finally works that combine both reconfigurable systems and dynamic techniques are discussed and a quantitative analysis of one them the DIM architecture is presented

Memory Management for Synthesis of DSP Software Praveen K. Murthy, Shuvra S. Bhattacharyya, 2018-12-14 Although programming in memory restricted environments is never easy this holds especially true for digital signal processing DSP The data rich computation intensive nature of DSP makes memory management a chief and challenging concern for designers Memory Management for Synthesis of DSP Software focuses on minimizing memory requirements during the synthesis of DSP software from dataflow representations Dataflow representations are used in many popular DSP design tools and the methods of this book can be applied in that context as well as other contexts where dataflow is used This book systematically reviews research conducted by the authors on memory minimization techniques for compiling synchronous dataflow SDF specifications Beginning with an overview of the foundations of software synthesis techniques from SDF descriptions it examines aggressive buffer sharing techniques that take advantage of specific and quantifiable tradeoffs between code size and buffer size to achieve high levels of buffer memory optimization The authors outline coarse level strategies using lifetime analysis and dynamic storage allocation DSA for efficient buffer sharing as one approach and demonstrate the role of the CBP consumed before produced parameter at a finer level using a merging framework for buffer sharing They present two powerful algorithms for combining these sharing techniques and then introduce techniques that are not restricted to the single appearance scheduling space of the other techniques Extensively illustrated to clarify the mathematical concepts Memory Management for Synthesis of DSP Software presents a comprehensive survey of state of the art research in DSP software synthesis
