- What are tailings? Tailings are finely ground muddy or sandy mine wastes left behind after the valuable metals and minerals have been extracted from the ore. Industrial-scale mining generates billions of tons of tailings every year worldwide, and contains toxic substances that can harm human health and the environment if not managed properly.

Tailings waste are typically stored behind large dams that can reach hundreds of metres in height and are built progressively over many years out of the mine's own waste material. When tailings dams fail they can release a powerful wave of waste and contaminated water that destroys communities and ecosystems.

Upstream dams, built up on top of the tailings themselves, are the most common (and often cheapest) type of dams, and have significant risks of failure, especially in seismic and wet climate areas.

Centreline and downstream dams, built on crushed rock or fill, are generally less vulnerable to failures.

Other types of tailings disposal that do not include large dams include: filtered and densified tailings cells (enclosed); "dry stack" surface piles (to be covered to prevent wind and water erosion); and putting tailings back in mined-out open pits or underground.

Tailings And Mine Waste 2003:

Tailings and Mine Waste 2003 Symposium Editors, 2003-01-01 Presenting cutting edge thinking in the fields of mine and mill tailings and mine waste these proceedings also discuss current and future issues facing the mining and environmental communities including matters dealing with technical capabilities and developments regulations and environmental concerns Papers address the following key areas site characterization and monitoring reclamation and remediation protective liners covers and barriers design operation and disposal groundwater and surface water quality and modelling geotechnical and geochemical aspects reprocessing utilization and treatment radioactivity and risk new technology policies and procedures case histories **Geotechnical and Environmental Aspects of Waste Disposal Sites** R.W. Sarsby, A.J. Felton, 2006-11-16 Despite the importance of preserving the environment in our developing world activity involving the extraction of natural resources and the disposal of waste continues to increase Such operations need to be conducted in a carefully controlled manner protecting both the natural environment and the communities who live in the vicinity Every four years the GREEN Geotechnics Related to the Environment symposia are held recognizing the major contribution that geotechnical engineering makes towards achieving the afore mentioned goals The meeting provides an international forum for the exchange of ideas experiences and innovations The GREEN 4 meeting discussed engineered disposal of waste in landfills land contaminated by waste disposal and fluid flows industrial waste dumps from mineral mining and extraction and environmental management The book contains expertise from nineteen countries around the world and provides an integrated view of the latest research and practice in waste disposal New and evolving ideas ongoing concerns and developments throughout the world are discussed Understanding and Responding to Hazardous Substances at Mine Sites in the Western United States Jerome V. DeGraff, 2007-01-01 This volume is a collection of papers resulting from a symposium held at the 2002 Annual Meeting of the Association of Environmental and Engineering Geologists in Reno Nevada The majority of the chapters present hydro geochemical studies of select sites but with the variety of localities and approaches taken this book will more widely appeal to land and resource managers geologists and engineers working with abandoned mines or modern site remediation efforts *Mine Wastes* Bernd Lottermoser, 2007-08-26 This book is not designed to be an exhaustive work on mine wastes It aims to serve undergraduate students who wish to gain an overview and an understanding of wastes produced in the mineral industry An introductory textbook addressing the science of such wastes is not available to students despite the importance of the mineral industry as a resource wealth and job provider Also the growing importance of the topics mine wastes mine site pollution and mine site rehabilitation in universities research organizations and industry requires a textbook suitable for undergraduate students til recently undergraduate earth science courses tended to follow rather classical lines focused on the teaching of palaeontology crystallography mineralogy petrology stratigraphy sedimentology structural geology and ore deposit geology However day and in the future earth science teachers

and students also need to be familiar with other subject areas. In particular, earth science curriculums need to address land and water degradation as well as rehabilitation issues. These topics are becoming more important to society and an increasing number of earth science students are pursuing career paths in this sector. Mine site rehabilitation and mine waste science are examples of newly emerging disciplines. This book has arisen out of teaching mine waste science to undergraduate and graduate science students and the frustration at having no appropriate text which documents the scientific fundamentals of such wastes.

Hard Rock Mine Reclamation Bruno Bussi re, Marie Guittonny, 2020-12-09. Hard rock mines have significant effects on the territories where they operate through both infrastructure construction as well as resource use. Due to their extractive activities, these mines store large quantities of wastes at the surface which can be both physically and chemically unstable. Reclamation aims to return a mine site to a satisfactory state meaning that the site should not threaten human health or security, should not generate in the long term any contaminant that could significantly affect the surrounding environment, and should be aesthetically acceptable to communities. This book focuses on the reclamation of waste storage areas which constitute the main source of pollution during and after mine operations and especially issues with acid mine drainage and neutral contaminated drainage. Features: Provides fundamental information and describes practical methods to reclaim mine waste facilities. Compares the different methods and illustrates their application at sites through case studies. Identifies new reclamation issues and proposes solutions to address them. Presents existing and new technologies to reclaim mine waste disposal areas from hard rock mines in different climatic conditions. Integrates reclamation into mine operations and long term performance of techniques used through an interdisciplinary approach. With mine site reclamation a young and still emerging science, the training needs for professionals and students working in this field are huge. This book is written from an engineering point of view and in it the authors identify new reclamation issues and propose well tested as well as innovative approaches to addressing them. Students in graduate programs focused on mines and the environment as well as professionals already working in departments related to mine site reclamation will find this book to be a valuable and essential resource.

Construction for a Sustainable Environment Robert Sarsby, Tamas Meggyes, 2009-11-03. The past fifty years have seen rapid development of public and governmental awareness of environmental issues. Engineers and scientists have made tangible contributions to environmental protection. However, further theoretical and practical developments are necessary to address mankind's growing demands on the environment.

Construction for a Sustainable Environment **Geotechnical Engineering for Mine Waste Storage Facilities** Geoffrey E.

Blight, 2009-11-16. The book is a comprehensive treatment of the application of geotechnical engineering to site selection, site exploration, design, operation, and closure of mine waste storage facilities. The level and content are suitable as a technical source and reference for practising engineers engaged both in the design and operational management of mine waste sites.

Towards a Sustainable Management of Mine Wastes Mostafa Benzaazoua, Yassine Taha, 2020-03-06. The need for efficient

and sustainable management methods of mine waste is continuously growing all around the world. These waste products often present serious management problems due to their more or less significant amounts and possible environmental threats. This Special Issue highlights the recent and new trends in sustainable mine waste management techniques. Currently, it is essential to sustainably manage mine waste considering social, economic, environmental, and technical aspects. In this Special Issue, insights related to the following issues are highlighted: the problems around mine waste, the fine characterization of mine waste, the latest available technical and environmental solutions to efficiently manage mine waste, including treatment and processing before disposal and high value element recovery with the view of moving towards defining effective low cost and ecofriendly methods, the recycling of mine waste products as alternative resources in different sectors, and finally laboratory pilot and/or industrial scale studies related to these topics of research. Scientists and industry and governance stakeholders have to face these new challenges to find the best management practices for the future.

Mine Waste Management in China: Recent Development Di Wu, 2019-07-30. This book introduces recent development of technologies for mine waste management in China. For hard rock mines, the main mine wastes are tailings, and the tailings can be disposed above ground and/or underground. The technology of consolidated tailings stockpile (CTS) that disposes tailings above ground is introduced, and the application of this technology is also demonstrated. Besides the technology of cemented tailings or paste backfill (CTB or CPB) which deals with tailings underground is also discussed. The properties of CTB materials and the utilization of CTB technology are described and analyzed. For coal mines, the main mine wastes are coal gangue and fly ash. The technology of cemented coal gangue fly ash backfill (CGFB) that manages coal mine waste underground is presented. The THMC coupling properties of CGFB materials are investigated, which can contribute to a better design of stable, durable, and environmentally friendly CGFB mixtures. The application of CGFB technology in a coal mine is also presented. This book, which systematically reviews and discusses the development of mine waste management technologies in China, is expected to provide readers comprehensive information about mine waste management.

Mining and its Impact on the Environment Fred G. Bell, Laurance J. Donnelly, 2006-04-20. Winner of the 2007 E. B. Burwell Jr Award of the Geological Society of America. Mining activity has left a legacy of hazards to the environment, such as waste, unstable ground, and contamination, which can be problematic when redeveloping land. This book highlights the effects of past mining and provides information on the types of problems it may cause.
