Targeted Therapies in Cancer

Manfred Dietel,2007-06-10 From its introduction oncological chemotherapy

has been encumbered by its poor selectivity because most antiproliferative drugs are toxic not only to tumor cells but also to important populations of the body s non neoplastic cells The resultant problems with unwanted side effects are compounded by difficulties in predicting the desired effectivity of chemotherapy in individual patients This unsatisfactory situation has driven intensive research and development towards more specific and less toxic anticancer drugs over the last few decades Several results of these efforts have reached the clinic and an even greater number are now in preclinical testing Common to all these targeted therapies is their interaction with defined molecules present on cancer cells which adds various degrees of increased selectivity to their toxic effects As a consequence detecting the target molecule on tumors before therapy holds great diagnostic potential for predicting the efficacy of the drug and personalizing therapy This book aims to present translational scientists and clinicians with an integrated critical view on the theories mechanisms problems and pitfalls of the targeted therapy approach

Targeted Therapies in Cancer: Francesco Colotta,Alberto Mantovani,2007-12-05 In

September 2005 an International Meeting on Targeted Therapies in Cancer Myth or Reality was held in Milan This successful Meeting was intended to represent a forum for scientists and clinicians working in cancer drug discovery and therapy to share their reflections and experiences on how the paradigm shift from empiricism to molecular targeted therapies is

contributing to the translation of basic knowledge into new therapies for cancer patients This book collects the contributions given by scientists and clinicians from Academia and Industry who participated to this Meeting We hope that this book contributes to improve our approach to cancer drug discovery and ultimately to find new more efficacious and better tolerated drugs for cancer patients It provides an overview of diverse approaches ranging from drug discovery to cellular therapy Although this change in paradigm has been useful its entry into the clinical arena was associated with unforeseen problems including the emergence of resistance unexpected side effects and failures Time is therefore ripe for a critical cultural reflection on the state of the art prospects and limitations Ultimately is targeted therapy in cancer a myth or a reality

Targeted Therapies in Cancer Marc Lacroix, 2016 Besides surgery radiation therapy endocrine therapy or chemotherapy which were widely used in cancer patients for decades the 21st century has seen the emergence of targeted therapy resulting from the identification of molecular pathways in cells and their alterations in tumors An increasing number of compounds targeting specific molecules or cancer cells have been developed and for some of them approved by the United States Food and Drug Administration FDA as well as other regulators in EU and Japan Additional new and more efficient types of compounds are still in clinical trials but are expected to gain future approval More than eighty FDA approved targeted therapies are described here along with about eighty other promising compounds These drugs are members of various therapy classes including tyrosine kinase inhibitors serine threonine kinase inhibitors dual specificity kinase inhibitors lipid kinase inhibitors poly ADP ribose polymerase inhibitors monoclonal antibodies microtubule targeting agents histone deacetylase inhibitors proteasome inhibitors antimetabolites immunomodulatory agents DNA methyltransferase inhibitors hedgehog pathway inhibitors enzymes protein translation inhibitors vaccines oncolytic viruses chimeric antigen receptor T cells CAR T and so on A series of companion diagnostics intended to be used as an indication for specific therapies and approved to this aim are also mentioned The book aims to present the broad landscape of compounds and companion diagnostics that are expected to pave the way towards a future of hope for cancer patients Targeted Therapies in Cancer Marc Lacroix, 2014-01-01 Since the year 2000 exciting developments in cancer therapy have occurred For decades in the 20th century the hallmark of medical treatment for cancer had been cytotoxic chemotherapy with drugs targeting rapidly dividing cells including cancer cells but also certain normal tissues As a result many patients experienced the classic toxicities of alopecia gastrointestinal symptoms and or myelosuppression In the last years however clinical research has been strongly occupied with the identification of mutations and aberrations concerning molecular pathways in cancer and their alterations which has enabled the emergence of a targeted somewhat personalized medicine approach to treatment Today although traditional cytotoxic chemotherapy remains the treatment of choice for many malignancies notably as first line agents targeted therapies are a possible choice for many types of cancer including breast prostate CRC lung kidney cancers as well as lymphoma leukemia and myeloma More than 60 of these targeted therapies recently approved by the United States

Food and Drug Administration FDA are detailed in the book and their intended use in one or more cancer types are shown

Molecularly Targeted Therapy for Childhood Cancer Peter J. Houghton, Robert J. Arceci, 2010-09-10 Each chapter will focus on the known molecular characteristics of specific childhood cancers focusing on how the molecular drivers can be exploited from a therapeutic standpoint with currently available targeted agents Where applicable integration of targeted therapies with conventional cytotoxic agents will be considered This volume will provide a comprehensive summary of molecular characteristics of childhood cancers and how the changes involved in transformation provide us with opportunities for developing relatively less toxic but curative therapies

Targeted Therapy of Colorectal Cancer Subtypes Peter Jordan, 2019-01-08 Colorectal cancer CRC is a leading cause of cancer related death worldwide Recent years have increased significantly our understanding of the genetic alterations that can underlie CRC but also unraveled the molecular heterogeneity of the disease Although a simple correlation between genetic pathways histopathological features and clinical outcome cannot be established the heterogeneity of CRC is also an opportunity for the development of targeted therapeutic approaches able to treat an individual tumor with higher efficiency and less toxic side effects One CRC subtype is characterized by high mutation rates MSI H DNA methylation changes CIMP H mutation in the BRAF oncogene and occurrence of serrated adenomas in the proximal colon Other groups prevail in the distal colon and consist of either adenomatous polyps with chromosomal aberrations CIN and WNT pathway activation or carry frequent KRAS mutation and metabolic deregulation or have strong mesenchymal and infiltrative characteristics Characterization of driver mutation events in these CRC subgroups has led to the development of specific drugs targeting for example the MAPK pathway but initial clinical trials have revealed unexpected response rates The collection of chapters in this volume address the biology of specific CRC subtypes and how these may be targeted to improve precision therapy and clinical benefit for the patients

targeted in lung cancer. It is now well established that there is tremendous heterogeneity among cancer cells both at the inter and intra tumoral level. Further, a growing body of work highlights the importance of targeted therapies and personalized medicine in treating cancer patients. In contrast to conventional therapies that are typically administered to the average patient regardless of the patient's genotype, targeted therapies are tailored to patients with specific traits. Nonetheless, such genetic changes can be disease specific and/or target specific; thus, the book addresses these issues manifested in the somatically acquired genetic changes of the targeted gene. Each chapter is written by a leading medical oncologist who specializes in thoracic oncology and is devoted to a particular target in a specific indication. Contributors provide an in-depth review of the literature covering the mechanisms underlying signaling, potential cross talk between the target and downstream signaling, and potential emergence of drug resistance.
