These results are very encouraging in the sense that they show that a relatively small number of villages can be used to estimate the impact of a policy on a large number of villages. This is a very important finding for policy evaluation.

Discussion. Evidence that granule cells found with receptor molecules on the surface of the microvilli. The developing receptor-associated synapses to the basal wall of the granule cells, where the synapses are characteristically concentrated across the synapses, shift to another segment. Immature cells have shorter dendrites, after which they are replaced by more cells generated from basal cells as the basis of the granule layer.

As a result of its cell-to-cell diffusion, on the distal end of cells, *Chlamydomonas* develops an specialized chemical synapse, or chemosynapse, located within the cell-cell synaptotheca. These synapses are composed by two small amounts of an extracellular matrix that can be isolated. The matrix recognizes the input from several different synapses to identify a particular action. Synapses can direct about 100,000 cells.

Odorous molecules in the blood stream are produced by the olfactory glands, then bind to olfactory mucin cells on the olfactory cilia. The response generated that is produced travels along the nerve to the olfactory bulb, which sends the signal to the higher brain centers. Unlike other senses, the olfactory receptors are connected directly to the central nervous system (that is, through the thalamus in the case of the other senses).

Neurons communicate with other cells at a synapse, the site of a narrow impulse transmission. The space between the presynaptic, or sending, neurone and the postsynaptic, or receiving, cell is called the synaptic cleft. An impulse arrives at the tip of the axon, the terminal button, where 'messengers' (molecules called neurotransmitters) that are highly specialised chemicals carry nerve impulses across the synaptic cleft between the axon and the adjacent neurone or cell, either enhancing or suppressing neural impulses in the target cell.
