Stability Domains:

   Frequency-domain Methods for Nonlinear Analysis Gennadi? Alekseevich Leonov,Dmitri? Viktorovich Ponomarenko,Vera B. Smirnova,1996 This book deals with the investigation of global attractors of nonlinear dynamical systems The exposition proceeds from the simplest attractor of a single equilibrium to more complicated ones i e to finite denumerable and continuum equilibria sets and further to cycles homoclinic and heteroclinic orbits and finally to strange attractors consisting of irregular unstable trajectories On the complicated equilibria sets the methods of Lyapunov stability theory are transferred They are combined with stability techniques specially elaborated for such sets The results are formulated as frequency domain criteria The methods connected with the theorems of existence of cycles and homoclinic orbits are developed The estimates of Hausdorff dimensions of attractors are presented **A First Course in the Numerical Analysis of Differential Equations** A. Iserles,1996-01-18 Numerical analysis presents different faces to the world For mathematicians it is a bona fide mathematical theory with an applicable flavour For scientists and engineers it is a practical applied subject part of the standard repertoire of modelling techniques For computer scientists it is a theory on the interplay of computer architecture and algorithms for real number calculations The tension between these standpoints is the driving force of this book which presents a rigorous account of the fundamentals of numerical analysis of both ordinary and partial differential equations The point of departure is mathematical but the exposition strives to maintain a balance between theoretical algorithmic and applied aspects of the subject In detail topics covered include numerical solution of ordinary differential equations by multistep and Runge Kutta methods finite difference and finite elements techniques for the Poisson equation a variety of algorithms to solve large sparse algebraic systems methods for parabolic and hyperbolic differential equations and techniques of their analysis The book is accompanied by an appendix that presents brief back up in a number of mathematical topics Dr Iserles concentrates on fundamentals deriving methods from first principles analysing them with a variety of mathematical techniques and occasionally discussing questions of implementation and applications By doing so he is able to lead the reader to theoretical understanding of the subject without neglecting its practical aspects The outcome is a textbook that is mathematically honest and rigorous and provides its target audience with a wide range of skills in both ordinary and partial differential equations *Variational and Optimal Control Problems on Unbounded Domains* Gershon Wolansky,Alexander J. framings and priorities Bringing together policy and theory Conservation and Development is an essential resource for undergraduate and postgraduate students and a useful reference for researchers in related fields Each chapter contains a reading guide with discussion questions The text is enlivened by a number of new case studies from around the world A must read for anyone interested in understanding the history current state and projections for future shifts in the relationship between conservation and development **Human Ecology** Gerald G.
