**Translational Research in Audiology, Neurotology, and the Hearing Sciences** Colleen G. Le Prell, Edward Lobarinas, Arthur N. Popper, Richard R. Fay, 2016-10-26 Translational Research is the interface between basic science and human clinical application including the entire process from animal studies to human clinical trials phases I II and III Translational Research moves promising basic science results from the laboratory to bedside application Yet this transition is often the least defined least understood part of the research process Most scientific training programs provide little or no systematic introduction to the issues challenges and obstacles that prevent effective research translation even though these are the key steps that enable high impact basic science to ultimately result in significant clinical advances that improve patient outcome This volume will provide an overview of key issues in translation of research from bedside to bench to bedside not only from the perspective of the key funding agencies but also from the scientists and clinicians who are currently involved in the translational research process It will attempt to offer insight into real world experience with intellectual property and technology transfer activities that can help move auditory technologies ahead as scientists and clinicians typically have little or no formal training in these areas Translational Research in Audiology and the Hearing Sciences will be aimed at graduate students and postdoctoral investigators as well as professionals and academics It is intended to function as a high profile and up to date reference work on Translational Research in the auditory sciences emphasizing research programs in the traditional areas including drugs and devices as well as less traditional still emerging areas such as sensorineural hearing loss auditory processing disorder cochlear implants and hearing aids and tinnitus therapies      *Otoacoustic Emissions* Martin S.
