SKELETAL SYSTEM

THE FRAMEWORK OF THE HUMAN BODY

Read the text below and then answer the questions.

The skeletal system, or skeleton, is made of bones, cartilage, ligaments, and ligaments. It is the framework of the human body. Its main function is to support the body and protect internal organs. It also provides a point of attachment for muscles, which allow movement. The skeleton is made of two parts: the skull, which protects the brain, and the rest of the body, which supports the body and protects internal organs.

Bones, the fundamental building blocks of the skeletal system, are made of a dense, hard material called bone. They are made of a hard, white, mineralized substance called bone. They are made of a hard, white, mineralized substance called bone. They are made of a hard, white, mineralized substance called bone.

Cartilage is a flexible, white, fibrous tissue that connects bones. It is found in the joints of the body, where it allows bones to move against each other. It is also found in the nose, ears, and larynx. It is made of a hard, white, mineralized substance called bone.

Ligaments are bands of fibrous tissue that connect bones. They are found in the joints of the body, where they hold bones together. They are made of a hard, white, mineralized substance called bone.

The skeletal system is not a static entity but rather a dynamic and adaptive one. Throughout life, bones undergo a process called remodeling, where old bone is broken down and new bone is formed. This process is controlled by hormones and mechanical stress.

The skeletal system is also involved in the production of blood cells. The bone marrow, which is found inside the bones, is the site where blood cells are produced. It is made of a hard, white, mineralized substance called bone.

The health of the skeletal system is largely determined by lifestyle factors. Regular exercise, a diet rich in calcium and vitamin D, and avoiding smoking and excessive alcohol consumption are all important for maintaining a healthy skeletal system.

As individuals age, the skeletal system undergoes natural changes. Bone density decreases, and the risk of fractures increases. However, adopting a proactive approach to bone health can mitigate these age-related changes. Regular weight-bearing exercise, proper nutrition, and a healthy lifestyle contribute significantly to maintaining a strong and functional skeleton.

In essence, the skeletal system is a testament to the intricate design and functionality of the human body. Beyond its foundational role in providing structural support, it is an active participant in various physiological processes.
