Weber, George Leitmann, 2004-05-10 The 11th International Workshop on Dynamics and Control brought together scientists and engineers from diverse fields and gave them a venue to develop a greater understanding of this discipline and how it relates to many areas in science engineering economics and biology The event gave researchers an opportunity to investigate ideas and techniques

**Stabilisation and Motion Control of Unstable Objects** Alexander M. Formal'skii, 2015-11-13 Systems with mechanical degrees of freedom containing unstable objects are analysed in this monograph and algorithms for their control are developed discussed and numerically tested This is achieved by identifying unstable modes of motion and using all available resources to suppress them By using this approach the region of states from which a stable regime can be reached is maximised The systems discussed in this book are models for pendula and vehicles and find applications in mechatronics robotics as well as in mechanical and automotive engineering

**Asymptotic Methods in Resonance Analytical Dynamics** Eugenii Grebenikov, Yu. A. Mitropolsky, Y.A. Ryabov, 2004-03-02 Asymptotic Methods in Resonance Analytical Dynamics presents new asymptotic methods for the analysis and construction of solutions mainly periodic and quasiperiodic of differential equations with small parameters Along with some background material and theory behind these methods the authors also consider a variety of problems and applications in nonlinear mechanics and oscillation theory The methods examined are based on two types the generalized averaging technique of Krylov Bogolubov and the numeric analytical iterations of Lyapunov Poincaré This text provides a useful source of reference for postgraduates and researchers working in this area of applied mathematics

**Dynamics and Robust Control of Robot-environment Interaction** Miomir Vukobratović, 2009 This book covers the most attractive problem in robot control dealing with the direct interaction between a robot and a dynamic environment including the human robot physical interaction It provides comprehensive theoretical and experimental coverage of interaction control problems starting from the mathematical modeling of robots interacting with complex dynamic environments and proceeding to various concepts for interaction control design and implementation algorithms at different control layers Focusing on the learning principle it also shows the application of new and advanced learning algorithms for robotic contact tasks The ultimate aim is to strike a good balance between the necessary theoretical framework and theoretical aspects of interactive robots

**Partial Stability and Control** V.I. Vorotnikov, 2012-12-06 Unlike the conventional research for the general theory of stability this monograph deals with problems on stability and stabilization of dynamic systems with respect not to all but just to a given part of the variables characterizing these systems Such problems are often referred to as the problems of partial stability stabilization They naturally arise in applications either from the requirement of proper performance of a system or in assessing system capability In addition a lot of actual or desired phenomena can be formulated in terms of these problems and be analyzed with these problems taken as the basis The

following multiaspect phenomena and problems can be indicated Lotka Volterra ecological principle of extinction focusing and acceleration of particles in electromagnetic fields drift of the gyroscope axis stabilization of a spacecraft by specially arranged relative motion of rotors connected to it Also very effective is the approach to the problem of stability stabilization with respect to all the variables based on preliminary analysis of partial stability stabilization A M Lyapunov the founder of the modern theory of stability was the first to formulate the problem of partial stability Later works by V V Rumyan tsev drew the attention of many mathematicians and mechanicians around the world to this problem which resulted in its being intensively worked out The method of Lyapunov functions became the key investigative method which turned out to be very effective in analyzing both theoretic and applied problems

### **Control of Nonlinear Mechanical Systems** Jan M.

Skowronski,2012-12-06 A modern mechanical structure must work at high speed and with high precision in space and time in cooperation with other machines and systems All this requires accurate dynamic modelling for instance recognizing Coriolis and centrifugal forces strong coupling effects flexibility of links large angles articulation This leads to a motion equation which must be highly nonlinear to describe the reality Moreover work on the manufacturing floor requires coordination between machines between each machine and a conveyor and demands robustness of the controllers against uncertainty in payload gravity external perturbations etc This requires adaptive controllers and system coordination and perhaps a self organizing structure The machines become complex strongly nonlinear and strongly coupled mechanical systems with many degrees of freedom controlled by sophisticated mathematical programs The design of such systems needs basic research in Control and System Dynamics as well as in Decision Making Theory Dynamic Games not only in the use of these disciplines but in their adjustment to the present demand This in turn generates the need to prepare engineering students for the job by the teaching of more sophisticated techniques in control and Mechanics than those contained in previous curricula On the other hand all that was mentioned above regarding the design of machines applies equally well to other presently designed and used mechanical structures or systems

### **Lyapunov Functions in Differential Games** Vladislav I

Zhukovskiy,2003-01-16 A major step in differential games is determining an explicit form of the strategies of players who follow a certain optimality principle To do this the associated modification of Bellman dynamic programming problems has to be solved for some differential games this could be Lyapunov functions whose arsenal has been supplied by stability theory This approach which combines dynamic programming and the Lyapunov function method leads to coefficient criteria or ratios of the game math model parameters with which optimal strategies of the players not only exist but their analytical form can be specified In this book coefficient criteria are derived for numerous new and relevant problems in the theory of linear quadratic multi player differential games Those criteria apply when the players formulate their strategies independently non cooperative games and use non Nash equilibria or when the game model recognizes noise perturbation and other uncertainties of which only their ranges are known differential games under uncertainty This text is useful for

Chukwu, 2003-01-23 Students and researchers in applied mathematics and applied economics can use this introductory level graduate text It looks at the current problems of the development of the global economy by studying the dynamics of key economic variables such as gross national product interest rates employment value of capital stock prices inflation and balance of payments Validation of the model is

attempted using the economic time series of several countries The constructed models explain the macroeconomic data of nations as dynamic games of pursuit which are equivalent to control problems and are used to study mathematical optimal control of the growth of the wealth of nations This invaluable reference for graduates and researchers compares the extent of government intervention in the economy with private firms to ensure the controllability of the economy Adaptive Mechanics Vladimir I Ugr'evich Tertychny-Dauri,V.Y. Tertychny-Dauri,2002-02-28 Over the last thirty years an abundance of papers have been written on adaptive dynamic control systems Nevertheless now it may be predicted with confidence that the adaptive mechanics a new division new line of inquiry in one of the violently developing fields of cybernetic mechanics is emerging The birth process falls far short of being completed There appear new problems and methods of their solution in the framework of adaptive nonlinear dynamics Therefore the present work cannot be treated as a certain polished brought to perfection school textbook More likely this is an attempt to show a number of well known scientific results in the parametric synthesis of nonlinear systems this strictly speaking accounts for the availability of many reviews as well as to bring to notice author's developments on this question undoubtedly modern and topical The nonlinear and practically Lagrangian systems cover a wide class of classical objects in theoretical mechanics and primarily solid body robotic gyroscopic rocket cosmic and other systems And what is rather important they have a direct trend to practical application To indicate this discussion I should like to notice that it does not touch upon the questions concerned with the linear and stochastic control objects Investigated are only nonlinear deterministic systems being in the conditions when some system parameters are either unknown or beyond the reach of measurement or they execute an unknown limited and fairly smooth drift in time
