Evolution from a

Thermodynamic Perspective Carl F Jordan, 2021-11-26 Survival of the fittest is a tautology because those that are fit are the ones that survive but to survive a species must be fit Modern evolutionary theory avoids the problem by defining fitness as reproductive success but the complexity of life that we see today could not have evolved based on selection that favors only reproductive ability There is nothing inherent in reproductive success alone that could result in higher forms of life Evolution from a Thermodynamic Perspective presents a non circular definition of fitness and a thermodynamic definition of evolution Fitness means maximization of power output necessary to survive in a competitive world Evolution is the storage of entropy Entropy storage means that solar energy instead of dissipating as heat in the Earth is stored in the structure of living organisms and ecosystems Part one explains this in terms comprehensible to a scientific audience beyond biophysicists and ecosystem modelers Part two applies thermodynamic theory in non esoteric language to sustainability of agriculture and to conservation of endangered species While natural systems are stabilized by feedback agricultural systems remain in a mode of perpetual growth pressured by balance of trade and by a swelling population The constraints imposed by thermodynamic laws are being increasingly felt as economic expansion destabilizes resource systems on which expansion depends

Ecology C. Lévêque, 2003-01-10 Eleven plants were chosen so as to cover a wide range of biological characteristics perennial annual autogamous allogamous etc in this study Three chapters on methodology complement these studies The first is devoted to the use of biological and molecular markers to analyse the diversity of collections the second addresses data analysis and the third describes a method for constituting core collections based on maximization of variability The Evolution of Population Biology Rama S. Singh, Marcy K. Uyenoyama, 2004-01-15 This 2004 collection of essays deals with the foundation and historical development of population biology and its relationship to population genetics and population ecology on the one hand and to the rapidly growing fields of molecular quantitative genetics genomics and bioinformatics on the other Such an interdisciplinary treatment of population biology has never been attempted before The volume is set in a historical context but it has an up to date coverage of material in various related fields The areas covered are the foundation of population biology life history evolution and demography density and frequency dependent selection recent advances in quantitative genetics and bioinformatics evolutionary case history of model organisms focusing on polymorphisms and selection mating system evolution and evolution in the hybrid zones and applied population biology including conservation infectious diseases and human diversity This is the third of three volumes published in honour of Richard Lewontin

Insect Ecology Peter W. Price, 1997-08-12 Insect Ecology is the world's foremost reference to the never ending and crucial interactions of the richest taxon of organisms on this earth with perhaps some 8 million extant species Now in its Third Edition and twentieth year of publication Insect Ecology has endured as an unparalleled classic Taking the reader from

an explanation of the science to its significance as a discipline Insect Ecology is a meticulous systematic examination of the underlying dynamics of plant insect interactions predation parasites and hosts and mutualistic relationships including pollination ecology that are central to understanding the insects role in nature Viewing the largely invisible drama of natural protagonists and antagonists hidden in the lush foliage of a tropical rain forest or temperate woody vegetation Peter Price details the unique traits behaviors and functions of insects while placing them in the broader contexts of their places in food webs ecosystem function population dynamics and community interactions The author also describes the various levels of insect interaction from trophic relationships Part II populations Part III and communities Part IV while unfolding the infinite variety of insect species and their visible legacy in the fossil record Full of fascinating details Ants are everywhere but only occasionally noticed They run much of the terrestrial world as the premier soil turners Insect galls provide tanning acids and the basis for inks Insect Ecology offers detail and breadth while providing timely discussion on the conservation of biodiversity the existence and study of vacant ecological niches latitudinal gradients in species richness and evolutionary perspectives on population dynamics The book also examines the development of theory in insect ecology and how it is advanced Novel features in the Third Edition include four new chapters covering the importance of insect ecology the development of theory in the science hypotheses on plant and herbivore interactions and a synthesis chapter on population dynamics Subheadings within chapters provide easier subject access and many new figures contribute to the book s aesthetic appeal Clearly organized and with a bibliography of 2 000 references to up to date and classic literature the Third Edition of Insect Ecology is a practical well formatted resource Also copiously illustrated with over 350 figures many new to this edition Insect Ecology is a lush graphic tour of the minute often startling universe of insects in their native habitat With a history in geologic time much older than the terrestrial vertebrates insects speak to us the scarab beetle encased in amber or New Zealand s endangered large Wellington speargrass weevil of a resilience and ingenuity oddly reflective of our own Insect Ecology has let generations of agriculturalists ecologists entomologists environmental scientists foresters professionals and students understand the insects world and ours With unerring detail and breadth Insect Ecology has described for generations of professionals the interactions and dynamics of the world s richest group of species the insects whose wildly various 8 million forms have been the source of endless fascination and study From caterpillars to the goliath beetle from the adult copper butterfly to the agromyzid fly the insect universe is at once ordinary and exotic capturing in microcosm nature s complexity and beauty

Evolutionary Ecology, 2011 Finally an eBook version of this now classic textbook has become available Largely based on the 6th edition published in 2000 this version is competitively priced Written by well known ecologist Eric R Pianka a student of the late Robert H MacArthur this timeless treatment of evolutionary ecology first published in 1974 will endure for many decades to come Basic principles of ecology are framed in an evolutionary perspective

Cuatro Ciénegas Ecology, Natural History and Microbiology Valeria Souza, Gabriela Olmedo-Álvarez, Luis E. Eguarte, 2018-10-02 The aim of this first book is to introduce the readers of the series to why Cuatro Ciénegas Basin CCB is so unique starting with the reason why astrobiologists became interested in this oasis in the first place namely the high diversity and abundance of stromatolites and microbial mats in continental waters to be found in the desert oasis As NASA has long since discovered the basin may offer the best analog of early Earth In essence CCB is a time machine that can take us far back and forth in time In the respective chapters the contributing authors explain the extraordinary microbial diversity of Cuatro Ciénegas Basin from various perspectives In order to do so they explain their journey as well as the different tools used to unravel the basin's mysteries such as Why are there so many species in a place without food How has life there survived the enormity of tectonic shifts through the ages maintaining its ancient marine heritage

Keywords in Evolutionary Biology Evelyn Fox Keller, Elisabeth Anne Lloyd, 1992 In science more than elsewhere a word is expected to mean what it says nothing more nothing less But scientific discourse is neither different nor separable from ordinary language meanings are multiple ambiguities ubiquitous Keywords in Evolutionary Biology grapples with this problem in a field especially prone to the confusion engendered by semantic imprecision Written by historians philosophers and biologists including among others Stephen Jay Gould Diane Paul John Beatty Robert Richards Richard Lewontin David Sloan Wilson Peter Bowler and Richard Dawkins these essays identify and explicate those terms in evolutionary biology which though commonly used are plagued by multiple concurrent and historically varying meanings By clarifying these terms in their many guises the editors Evelyn Fox Keller and Elisabeth Lloyd hope to focus attention on major scholarly problems in the field problems sometimes obscured sometimes reveals and sometimes even created by the use of such equivocal words Competition adaptation and fitness for instance are among the terms whose multiple meaning have led to more than merely semantic debates in evolutionary biology Exploring the complexity of keywords and clarifying their role in prominent issues in the field this book will prove invaluable to scientists and philosophers trying to come to terms with evolutionary theory it will also serve as a useful guide to future research into the way in which scientific language works

The Evolution of Agency and Other Essays Kim Sterelny, 2001 This book presents a collection of linked essays written by one of the leading philosophers of biology Kim Sterelny on the topic of biological evolution The first half of the book explores most of the main theoretical controversies

about evolution and selection Sterelny argues that genes are not the only replicators non genetic inheritance is also extremely important and is no mere epiphenomenon of gene selection The second half of the book applies some of these ideas in considering cognitive evolution Concentrating on the mental capacities of simpler animals rather than those of humans Sterelny argues for a general distinction between detection and representation and that the evolution of belief like that of representation can be decoupled from the evolution of preference These essays some never before published form a coherent whole that defends not just an overall conception of evolution but also a distinctive take on cognitive evolution

Life through Time and Space Wallace Arthur, 2017-08-07 All humans share three origins the beginning of our individual lives the appearance of life on Earth and the formation of our planetary home Wallace Arthur combines embryological evolutionary and cosmological perspectives to tell the story of life on Earth and its potential to exist elsewhere in the universe

Genetics and the Extinction of Species Laura Landweber, Andrew Dobson, 2021-01-12 Darwin's Origin of Species and Dobzhansky's Genetics and the Origin of Species have been the cornerstones of modern evolutionary and population genetic theory for the past hundred years but in the twenty first century biologists will face graver problems of extinction In this collection a team of leading biologists demonstrates why the burgeoning field of conservation biology must continue to rely on the insights of population genetics if we are to preserve the diversity of living species Technological and theoretical developments throughout the 1990s have allowed for important new insights into how populations have evolved in response to past selection pressures while providing a broad new understanding of the genetic structure of natural populations The authors explore these advances and argue for the applicability of new genetic methods in conservation biology The volume covers such topics as the reasons for extinctions the best ways to measure biodiversity and the benefits and drawbacks of policies like captive breeding Genetics and the Extinction of Species is a rich source of information for biologists and policymakers who want to learn more about the host of tools theories and approaches available for conserving biodiversity In addition to the editors the contributors to the volume are William Amos Rebecca Cann Kathryn Rodriguez Clark Leslie Douglas Leonard Freed Paul Harvey Kent Holsinger Russell Lande and Helen Steers

Interaction theory in forest

ecology and management Rolfe A. Leary, 2012-12-06 As I understand it a book Preface is where the author explains to the reader how the book in hand came about something of the personal reasons for having inflicted such extended duress on one's self to complete the manuscript and other items that are fit to say but do not fit in the text This book had its conceptual beginnings in the 1970s with my studies in scientific synthesis at the North Central Forest Experiment Station St Paul Minnesota Ours is clearly the age of analysis But I felt we must soon begin frameworks for synthesis or a synthesis would never be possible In short I hoped to develop interaction as an integrative principle in forestry As work progressed on the manuscript other subthemes developed First there was the vague feeling on my part that the forestry profession was losing ground in the contest to see who should manage the forests of the world This was happening not because foresters do not

know how to manage forests in a reasonable manner but because the public seemed to be losing faith in the judgement of foresters as professional responsible wise land managers Several well known incidents of poor judgement in timber harvesting methods on national forests in the United States did little to help the forester's image

Herbal Intelligence

David Hoffmann, 2024-08-06 Reveals how herbalism is a powerful way to participate in the green transformation underway in our culture Examines the radical and non hierarchical roots of herbalism the growth of spiritual awakening and social radicalism Looks at the most recent research in herbalism revealing the exponential growth in peer reviewed literature covering phytotherapy and other herbal oriented healing modalities Providing a comprehensive guide to the dynamic new landscape of modern herbalism renowned medical herbalist David Hoffmann explores how ancient healing modalities are once again becoming prominent Using the concept of *viriditas* the understanding of nature as divinely intelligent Hoffmann examines biodiversity and chemodiversity elaborating on the ecological role of human herb interactions and coevolutionary relationships between species Presenting evidence of medicinal plant use by animals and early humans he reviews herbalism from its ancient roots to the modern varieties in practice today emphasizing how herbalism that developed outside of the dominant culture laid the foundations for the effective simple techniques relevant for our modern world He examines the radical and non hierarchical roots of herbalism considering the parallels between the field's development and the growth of spiritual awakening and social radicalism Exploring herbalism through the modern scientific lens Hoffmann reveals the exponential growth in recent research and peer reviewed literature on phytotherapy and herbs He describes the problems inherent in herbalism's integration into the global marketplace emphasizing that herbalism must stay rooted in the health of the people to avoid becoming commodified He offers a range of herbal approaches to support personal and cultural resilience during the myriad crises humanity is facing Ultimately Hoffmann says a vibrant culture of herbalism can have critical implications for the future serving as a crucial force for health and resilience

Evolutionary Thinking Across Disciplines

Agathe du Crest, Martina Valković, André Ariew, Hugh Desmond, Philippe Huneman, Thomas A. C. Reydon, 2023-06-26 This volume aims to clarify the epistemic potential of applying evolutionary thinking outside biology and provides a survey of the current state of the art in research on relevant topics in the life sciences the philosophy of science and the various areas of evolutionary research outside the life sciences By bringing together chapters by evolutionary biologists systematic biologists philosophers of biology philosophers of social science complex systems modelers psychologists anthropologists economists linguists historians and educators the volume examines evolutionary thinking within and outside the life sciences from a multidisciplinary perspective While the chapters written by biologists and philosophers of science address theoretical aspects of the guiding questions and aims of the volume the chapters written by researchers from the other areas approach them from the perspective of applying evolutionary thinking to non biological phenomena Taken together the chapters in this volume do not only show how evolutionary thinking can be fruitfully applied in various areas of investigation but also

highlight numerous open problems unanswered questions and issues on which more clarity is needed As such the volume can serve as a starting point for future research on the application of evolutionary thinking across disciplines

Insect Populations In theory and in practice Jack P. Dempster,Ian F.G. McLean,2012-12-06 Insects are by far the largest group of animals on Earth with over a million described species and they occupy a wide range of ecological niches they may be herbivores predators parasites or decomposers Some are of particular economic importance as pests of agriculture and forestry as vectors of animal and human disease or as species of interest to wildlife conservation Thus an understanding of the processes determining their numbers is of considerable practical value Entomologists have played a leading role in developing a theoretical basis to Population Ecology but we still do not have adequate experimental and observational proof for many of the theoretical ideas that have been proposed As a result the subject has been beset with arguments for more than 50 years This volume attempts to reconcile some of these controversies while also reviewing the current state of our knowledge The editors have drawn together an international list of contributors whose views reflect a range of opinions on how natural populations are stabilised They have succeeded in producing a book that both covers the main alternative views in population theory and contains some of the best recent field studies of insect populations This Royal Entomological Society Symposium volume will be of great interest to all entomologists and ecologists particularly those who wish to know more about Population Dynamics

Stories of Home Devika Chawla,Stacy Holman Jones,2015-09-17 Stories of Home Place Identity Exile offers a window into the distinct ways that home is theorized and conceptualized across disciplines The essays in this volume consider how people speak and story home in their everyday lives why home is central to our notion of who we are and how making home a unit of analysis in research makes a strong conceptual contribution to the field of communication This collection engages home from diverse contexts and disparate philosophical underpinnings at the same time the essays converse with each other by centering their foci on the relationship between home place identity and exile Home how we experience it and what it says about the selves we come to occupy is an exigent question of our contemporary moment Stories of Home Place Identity Exile delivers timely and critical perspectives on these important questions

Entangled Life Gillian Barker,Eric Desjardins,Trevor Pearce,2013-09-05 This volume explores the interactions between organisms and their environments and how this entanglement is a fundamental aspect of all life It brings together the work and ideas of historians philosophers biologists and social scientists uniting a range of new perspectives methods and frameworks for examining and understanding the ways that organisms and environments interact The volume is organized into three main

sections historical perspectives contested models and emerging frameworks The first section explores the origins of the modern idea of organism environment interaction in the mid nineteenth century and its development by later psychologists and anthropologists In the second section a variety of controversial models from mathematical representations of evolution to model organisms in medical research are discussed and reframed in light of recent questions about the interplay between organisms and environment The third section investigates several new ideas that have the potential to reshape key aspects of the biological and social sciences Populations of organisms evolve in response to changing environments bodies and minds depend on a wide array of circumstances for their development cultures create complex relationships with the natural world even as they alter it irrevocably The chapters in this volume share a commitment to unraveling the mysteries of this entangled life
