Peptide Growth Factors and Their Receptors I Michael B. Sporn, Anita B. Roberts, 2012-12-06 This two volume treatise the collected effort of more than 50 authors represents the first comprehensive survey of the chemistry and biology of the set of molecules known as peptide growth factors Although there have been many symposia on this topic and numerous publications of reviews dealing with selected subsets of growth factors the entire field has never been covered in a single treatise It is essential to do this at the present time as the number of journal articles on peptide growth factors now makes it almost impossible for anyone person to stay informed on this subject by reading the primary literature At the same time it is becoming increasingly apparent that these substances are of universal importance in biology and medicine and that the original classification of

these molecules based on the laboratory setting of their discovery as growth factors lymphokines cytokines or colony stimulating factors was quite artifactual they are in fact the basis of a common language for intercellular communication As a set they affect essentially every cell in the body and in this regard they provide the basis to develop a unified science of cell biology germane to all of biomedical research This treatise is divided into four main sections After three introductory chapters its principal focus is the detailed description of each of the major peptide growth factors in 26 individual chapters

Ultrastructure of Skeletal Tissues E. Bonucci, P. Motta, 2012-12-06 The calcified tissues have fundamental functions in the biology of organisms not only because their strength solidity and elasticity permit movement and mechanical activities and protect soft tissues against traumatic forces but also on account of their role in mineral homeostasis For this reason extensive investigation in the last 30 years has provided much to explain the complex chemical and physical processes occurring in cells and matrices composing the skeleton and their alterations in pathological conditions The use of ultrastructural methods such as immunocytochemistry scanning and transmission electron microscopy cytoautoradiography freeze fracture etching high voltage etc has proven to

be of great value when applied to cells and matrix components of bone and cartilage in spite of the technical difficulties due to the hardness of these tissues. However, available information on this subject is disseminated in a variety of scientific and medical articles. This volume is an attempt to collect together the most significant data on the ultrastructure of cartilage and bone in normalcy and pathology. Obviously, it cannot be a complete report of all these data; its principal aim being that of giving a comprehensive statement of the results concerning the basic structures common to these tissues, especially collagen fibrils, noncollagenous proteins and proteoglycans, and their relationships with the mineral substance for which another volume of this series can also be consulted. See Ruggeri A, Motta P M eds. **Principles and Practice of Endocrinology and Metabolism**. Kenneth L. Becker, 2001. Established as the foremost text in the field, *Principles and Practice of Endocrinology and Metabolism* is now in its thoroughly revised, updated Third Edition. This practical, clinically relevant and comprehensive text covers the entire field of endocrinology and metabolism, including the diffuse endocrine system, morphology and physiology, diagnosis and treatment of endocrine diseases, endocrinology of the female hormones and cancer, and much more. A drug formulary appears at the back of the book.

Written by renowned experts in the field, this two-volume work is a must-have for academic and medical libraries, physicians, researchers, and any company involved in osteoporosis research and development. This newest edition covers everything from basic anatomy and physiology to diagnosis, management, and treatment, in which direct care costs for osteoporotic fractures in the United States reach up to 18 billion each year. Worldwide, 200 million women ages 60 to 80 suffer from osteoporosis and have a lifetime risk of fracture between 30% and 40%, continuing to make osteoporosis a critical challenge in medicine. Recognizes the critical importance of the Wnt signaling pathway for bone health. Incorporates new chapters on osteocytes, phosphatonins, mouse genetics, and CNS and bone. Examines essential updates on estrogen prevention and treatment and the recent results from the WHO. Discusses the controversial topics of screening and clinical trial design for drug registration.
