Strategies and Tactics in Organic Synthesis Gopal Sirasani, Rodrigo B. Andrade, 2013-07-29 Described herein is an account of my laboratory's entry into the magnificent field of complex alkaloid total synthesis spanning the development of novel methods for quickly assembling polycyclic frameworks through the total synthesis of various members of the Strychnos alkaloids A discussion of the prior art related to our approach to these alkaloids in addition to strategic

decisions and reasoning made en route to targets akuammicine 1 strychnine 2 and leuconicines A 3 and B 4 is carefully detailed Finally we present the retrosynthetic analyses of the aforementioned targets and respective total syntheses thereof including asymmetric variants

Strategies and Tactics in Organic Synthesis Michael F. Greaney, Lei Shi, Naim Nazef, 2013-07-29 This chapter describes the synthesis of two related sesquiterpenes anislactone A and merrilactone A We initially accessed a tetracyclic oxetane in the merrilactone series using a Patern B chi reaction but found the compound to be too underfunctionalized to advance further We then developed an approach based on reductive epoxide ring opening whereby a fully elaborated C ring epoxy cyclopentane containing five stereocenters could undergo reductive epoxide cleavage when treated with Ti III The resulting tertiary radical then participates in a 5 exo dig cyclization onto a pendant alkyne to afford the complete carbon skeleton of both natural products From this point orthogonal functionalization routes enabled the synthesis of both anislactone A and merrilactone A A second generation merrilactone A synthesis is then described growing out of discoveries made over the course of the first route in the area of cyclopentannulation An iodo aldol method was used to develop an approach to the anislactone skeleton and succeeded in producing the BC bicycle with good stereocontrol and functional group tolerance Further functionalization however did not prove possible due to excessive steric hindrance around the incorporated iodo group preventing any productive transformation This problem was solved by switching the nucleophile in the tandem aldol process to cyanide The resulting domino cyanide addition aldol cyclization was then successfully employed in the formal synthesis of merrilactone A using a late stage 2 2 photocycloaddition to access the D ring
