1. Incision: A small incision, approximately 3mm in width, is made at the corneal margin.

2. Emulsification: Phacoemulsification probe is inserted through corneal incision and ultrasound breaks cataract up into microscopic fragments, which can then be aspirated using the probe tip.

3. Intraocular Lens Implant: The artificial foldable intraocular lens is inserted and, once inside, the lens unfolds.

4. Result: The new lens is in place, the small incision heals naturally without the need for sutures, and vision is restored.
