Skin Immune System Cutaneous Immunology And Clinical Immunodermatology:

Skin Immune System (SIS) Jan D. Bos, 1997-04-10 Immunodermatology is a field covering the majority of skin diseases including the most prevalent ones in the general population. The Second Edition of Skin Immune System SIS discusses immune mediated skin diseases and disease groups in which the SIS plays a role. It covers major findings in immunophysiology and immunopathology that have occurred since the introduction of the First Edition in 1990. As the subtitle indicates, the Second Edition adds a new emphasis on cutaneous immunology and also includes new information on immune based therapeutic interventions and methods such as phototherapy and the immunological therapy of skin cancer. The book contains Part I with introductory chapters, Part II with descriptions of the cellular elements, and Part III which describes the humoral and molecular components of SIS. Part IV follows to integrate the facts described in Parts II and III into concepts of pathophysiology. It contains a number of concepts entitled response patterns that describe how the constitutional elements of SIS work together. New in this edition are the descriptions of immunodermatological diseases individually described in Part V. Part VI is also all new and summarizes principles of immunotherapy.

Skin Immune System Jan D. Bos, 2005 Top scientific authors contribute their expertise and put a wealth of complex information into perspective in Skin Immune System Cutaneous Immunology Clinical Immunodermatology Third Edition. This edition provides an overview of the skin immune system SIS, a totally updated section on immunodermatological diseases, and six new chapters. Part I presents historical and comparative information on immunodermatology and includes a new chapter on the immunogenetics of inflammatory skin disease, while Part II covers the cellular elements of SIS and highlights newly defined functional subclasses of cells. Part III describes the humoral elements of SIS and provides two new chapters which focus on defensins and cathelicidins and on the chemokines of human skin. Part IV discusses how the cellular and humoral elements of SIS interact under different circumstances and includes a new chapter on signal transduction pathways in cutaneous immunology. Part V focuses on dermatological diseases with a significant immunological background, with a new chapter on the immunology of cutaneous drug eruptions, followed by Part VI on immunotherapy in dermatology which features a new chapter reflecting the recent wave of products from biotechnology. Since the publication of the previous editions, a great deal of significant information has become available in almost all areas of cutaneous immunology and clinical immunodermatology. This progress has now been reflected in a completely updated and expanded resource.

Clinical and Basic Immunodermatology Anthony Gaspari, Stephen K. Tyring, 2008-11-05 Dermatologists are being asked to understand the pathophysiology of a number of immune mediated skin diseases. In addition, a number of new products have appeared on the market during the past decade which requires an understanding of the mechanisms of action of these drugs. Dermatologists, however, have no easily understood book to which they can refer to regarding the disease or the drug.

Skin Cancer after Organ Transplantation Eggert Stockfleth,Claas Ulrich,2009-05-05 Organ transplantation has been performed for almost 40 years with steadily increasing success regarding long time survival of the graft as well as quality of life for the patient However graft tolerance only can be achieved via induction and maintenance of an impaired immunological surveillance An increase of skin cancers as a consequence of the lowered cellular immunoresponse seems to

parallel the overall increased long time survival rate of organ transplant recipients Against the background of chronic immunosuppression known risk factors like the amount of sun exposure prior and post transplantation oncogenic viruses as well as the genetic background and place of residence latitude are strongly related with the increased skin cancer incidence The increasing incidence of non melanoma skin cancer paralleling a prolonged survival of patients after organ transplantation represents a significant reason for morbidity and long term morbidity in organ transplant recipients worldwide The incidence of non melanoma skin cancer in liver kidney and heart transplant recipients varies from 1.5 to 22 % 2 to 24 % and 6 to 34 % after 5 years post transplant Ultraviolet radiation as well as immunosuppressive therapy are crucial risk factors regarding the induction and progression of skin cancer Ultraviolet radiation is related to the induction of DNA damage as well as interference with Langerhans cell antigen presentation and a Th1 Th2 shift induced via a release of IL 10 Whereas the overall duration of immunosuppression and the cumulative dosage applied are relevant parameters in the evaluation of an increased tumor risk individual differences between specific immunosuppressive agents remain unclear The workup of genetic as well as other unclear phenomenon like the reverse BCC SCC ratio might shed some further light into the genesis and immunology of the non melanoma skin cancer in general
