Biology of Cognitive Aging: Model Systems, Technologies and beyond Shin

Murakami,2017-04-13 Welcome We humans tend to experience forgetfulness when we get old The forgetfulness may become more serious memory impairment dementia Presumably we have known it for a long time but we still do not know the mechanism behind A normal part of forgetfulness is called age related memory impairment AMI which is considered the first step towards mild cognitive impairment MCI transition state and dementia disease state The majority of dementia is attributable to Alzheimer s disease AD Progression to dementia occurs at a high rate in patients with AMI This eBook covers exciting but yet challenging field of cognitive aging AMI is specific to neural tissues of the brain and is considered to be segmental aging It happens not only to humans but also to a variety of species Learning and memory are vulnerable to aging in a wide variety of model species including worms fruit flies insects snails fishes and rodents Aging specifically reduces the ability to learn new information but leaves old memories and procedural memory intact A comparative approach including the use of model systems seems to facilitate understanding of the molecular mechanisms that lead to AMI and AD We advocate research on model systems This eBook also provides the first manuscript co authored with an AD patient to create a feedback loop from patients incorporated into research We also included a manuscript on the semi automated system that was inspired by such a feedback Those may place a nice flavor to this exciting series of comparative research on cognitive aging We hope you enjoy this eBook Warm regards Shin Murakami Ph D

Aging and Cognition Hayden B.

Bosworth,Christopher K. Hertzog,2009 As the world s population ages the study of aging and its effects on cognition becomes increasingly important Aging and Cognition Research Methodologies and Empirical Advances takes an interdisciplinary look at cognitive aginghow it happens and how to study it The first part of the book explores methods for measuring cognitive change including how to study cohort effects How can we account for differences in cognitive performance from one cohort to another Should we assume factor invariance across cohorts or time These issues are treated in the context of new and existing empirical research making the discussion of methodological issues more concrete and

accessible The second part of the book explores the social and psychological factors associated with cognitive aging For example to what extent do socioeconomic status optimism and personal sense of control affect aging Is the controversial use it or lose it theory of cognition valid Finally the concluding section explores how to use research findings to improve the everyday functioning of adults a challenging task because everyday functioning relies on complex cognitive tasks and most cognitive research measures only basic cognitive tasks The chapter in this final section uses medication adherence as an example of deriving real world solutions from cognitive research results With its emphasis on social and contextual factors that influence aging this book showcases both substantive and methodological developments in the field It will be useful to everyone who studies aging and cognition Jacket PsycINFO Database Record c 2009 APA all rights reserved *The Cambridge Handbook of Cognitive Aging* Ayanna K. Thomas,Angela Gutches,2020-05-28 Decades of research have demonstrated that normal aging is accompanied by cognitive change Much of this change has been conceptualized as a decline in function However age related changes are not universal and decrements in older adult performance may be moderated by experience genetics and environmental factors Cognitive aging research to date has also largely emphasized biological changes in the brain with less evaluation of the range of external contributors to behavioral manifestations of age related decrements in performance This handbook provides a comprehensive overview of cutting edge cognitive aging research through the lens of a life course perspective that takes into account both behavioral and neural changes Focusing on the fundamental principles that characterize a life course approach genetics early life experiences motivation emotion social contexts and lifestyle interventions this handbook is an essential resource for researchers in cognition aging and gerontology **The Oxford Handbook of Emotion, Social Cognition, and Problem Solving in Adulthood** Paul Verhaeghen,Christopher K. Hertzog,2014 Oxford Library Of Psychology **Generative Mental Processes and Cognitive Resources** U. Hecker,Stefan Dutke,Grzegorz Sedek,2012-12-06 In recent years a booming research interest has been observed in linking basic cognitive processes with a variety of social and clinical phenomena Evidence comes from the increasing popularity of psychological paradigms such as social cognition cognitive psychopathology or cognitive aging What links those paradigms is their special focus on explaining cognitive phenomena by use of the concept of mental resources Immediate reasons for such a focus are found in the growing emphasis on understanding everyday dynamics of thinking and acting within a complex world as well as within personal constraints Obviously our current goals and choice of activities constrain and influence our reasoning as well as the processes of input to and retrieval from memory Situational demands will act to the same effect and the interplay between both internal and external constraints makes apparent a first and straightforward relevance of the resource notion in action oriented cognitive research For example person perception is a dynamic process depending on what my goals in perception are what the perceiving situation is that I find myself in and how complex the target characteristics are In fact the amount of resources spent in this process may be reflected in its speed the

quality of the perceptual or mnemonic trace which is being created or the kind of social or non social behavior that can be supported

Memory and Aging Moshe Naveh-Benjamin, Nobuo Ohta, 2012 Current demographical patterns predict an aging worldwide population It is projected that by 2050 more than 20% of the US population and 40% of the Japanese population will be older than 65 A dramatic increase in research on memory and aging has emerged to understand the age related changes in memory since the ability to learn new information and retrieve previously learned information is essential for successful aging and allows older adults to adapt to changes in their environment self concept and social roles This volume represents the latest psychological research on different aspects of age related changes in memory Written by a group of leading international researchers its chapters cover a broad array of issues concerning the changes that occur in memory as people grow older including the mechanisms and processes underlying these age related memory changes how these changes interact with social and cultural environments and potential programs intended to increase memory performance in old age Similarly the chapters draw upon diverse methodological approaches including cross cultural extreme group experimental designs longitudinal designs assessing intra participant change and computational approaches and neuroimaging assessment Together they provide converging evidence for stability and change in memory as people grow older for the underlying causes of these patterns as well as for the heterogeneity in older adults performance *Memory and Aging* is essential reading for researchers in memory cognitive aging and gerontology
