Engineering Second Edition incorporates the substantial technological advances and research developments in photovoltaics since its previous release. All topics relating to the photovoltaic PV industry are discussed with contributions by distinguished international experts in the field. Significant new coverage includes three completely new chapters and six chapters with new authors: device structures, processing and manufacturing options for the three major thin film PV technologies, high performance approaches for multijunction concentrator and space applications, new types of organic polymer and dye sensitized solar cells, economic analysis of various policy options to stimulate PV growth including effect of public and private investment. Detailed treatment covers scientific basis of the photovoltaic effect and solar cell operation, the production of solar silicon and of silicon based solar cells and modules, how choice of semiconductor materials and their production influence costs and performance, making measurements on solar cells and modules and how to relate results under standardised test conditions to real outdoor performance, photovoltaic system installation and operation of components such as inverters and batteries, architectural applications of building integrated PV. Each chapter is structured to be partially accessible to beginners while providing detailed information of the physics and technology for experts. Encompassing a review of past work and the fundamentals in solar electric science, this is a leading reference and invaluable resource for all practitioners, consultants, researchers and students in the PV industry.

*MEMS and Microstructures in Aerospace Applications* Robert Oslander, M. Ann Garrison Darrin, John L. Champion, 2018-10-03. The promise of MEMS for aerospace applications has been germinating for years and current advances bring the field to the very cusp of fruition. Reliability is chief among the challenges limiting the deployment of MEMS technologies in space as the requirement of zero failure during the mission is quite stringent for this burgeoning field. *MEMS and Microstructures in Aerospace Applications* provides all the necessary tools to overcome these obstacles and take MEMS from the lab bench to beyond the exosphere. The book begins with an overview of MEMS development and provides several demonstrations of past and current examples of MEMS in space. From this platform the discussion builds to fabrication technologies, the effect of space environmental factors on MEMS devices and micro technologies for space systems, instrumentation, communications, thermal control, guidance, navigation and control, and propulsion. Subsequent chapters explore factors common to all of the described systems such as MEMS packaging, handling and contamination control, material selection for specific applications, reliability practices for design and application, and assurance practices. Edited and contributed by an outstanding team of leading experts from industry, academia and national laboratories, *MEMS and Microstructures in Aerospace Applications* illuminates the path toward qualifying and integrating MEMS devices and instruments into future space missions and developing innovative satellite systems.
