CRC Handbook of Viruses Horace M. Mazzone, 1998-05-13 As a distinct class of macromolecules viruses are continually being studied in order to determine their properties Following a knowledge of host range infectivity the particle mass molecular weight of the virus and related properties including size shape sedimentation and diffusion coefficients are also important characterizations In the literature these values have been determined for many viruses and a variety of techniques are available by which such properties may be analyzed Until now there has been no single source for such information that the interested investigator may consult and no databases provided this kind of information CRC Handbook of Viruses Mass Molecular Weight Values and Related Properties corrects this deficiency by presenting such data for all classes of viruses centering on viruses their molecular weight and their related properties and acquainting the investigator to many methods for obtaining the mass molecular weight value of viruses This singular study explains the variety of methods available to the researcher as well as provides examples of each method Molecular weight values are accessed directly from the book saving the investigator a tedious search through the range of literature Chapters discuss Viruses as infectious agents and their role in establishing the relatively new discipline of molecular biology Essential components of viruses protein and nucleic acid considering their discovery nature structural organization and the forming of viruses from nucleoproteins Basic aspects of virus purification preparative centrifuge and various purification methods Basic aspects of crystallography including procedures x ray analysis of the viral protein component the arranging of subunits and the composition of the intact virus Sedimentation experiments and studies used to obtain molecular weight Sedimentation and diffusion coefficients integral to the basic Svedberg equation Sedimentation equilibrium procedures The new Beckman Optima series of analytical ultracentrifuges Scattering studies including small angle x ray small angle neutron classical light scattering and electron microscopy The renaissance of instrumentation in classical light scattering techniques Cold neutron facilities currently being set into operation by government laboratories Sizing and solvation of viruses in solution their natural environment Critical modeling experiments Facilities and instrumentation for molecular weight studies including the high voltage transmission electron microscope for obtaining mass values of viral inclusion bodies CRC Handbook of Viruses serves the Researcher seeking values of virus molecular weight and related parameters Investigator getting started in virology and seeking information on physical chemical procedures Student interested in viruses as infectious agents

Biology, Computing, and the History of Molecular Sequencing M.

García-Sancho,2012-05-11 Sequencing is often associated with the Human Genome Project and celebrated achievements concerning the DNA molecule However the history of this practice comprises not only academic biology but also the world of computer assisted information management The book uncovers this history qualifying the hype and expectations around genomics

The Black Box of Biology Michel Morange,2020-06-09 In this masterful account a historian of science surveys the molecular biology revolution its origin and continuing impact Since the 1930s a molecular vision has been transforming biology Michel Morange provides an incisive and overarching history of this transformation from the early attempts to explain organisms by the structure of their chemical components to the birth and consolidation of genetics to the latest technologies and discoveries enabled by the new science of life Morange revisits *A History of Molecular Biology* and offers new insights from the past twenty years into his analysis *The Black Box of Biology* shows that what led to the incredible transformation of biology was not a simple accumulation of new results but the molecularization of a large part of biology In fact Morange argues the greatest biological achievements of the past few decades should still be understood within the molecular paradigm What has happened is not the displacement of molecular biology by other techniques and avenues of research but rather the fusion of molecular principles and concepts with those of other disciplines including genetics physics structural chemistry and computational biology This has produced decisive changes including the discoveries of regulatory RNAs the development of massive scientific programs such as human genome sequencing and the emergence of synthetic biology systems biology and epigenetics Original persuasive and breathtaking in its scope *The Black Box of Biology* sets a new standard for the history of the ongoing molecular revolution

The Life of a Virus
Angela N. H. Creager, 2002 We normally think of viruses in terms of the devastating diseases they cause from smallpox to AIDS But in The Life of a Virus Angela N H Creager introduces us to a plant virus that has taught us much of what we know about all viruses including the lethal ones and that also played a crucial role in the development of molecular biology Focusing on the tobacco mosaic virus TMV research conducted in Nobel laureate Wendell Stanley's lab Creager argues that TMV served as a model system for virology and molecular biology much as the fruit fly and laboratory mouse have for genetics and cancer research She examines how the experimental techniques and instruments Stanley and his colleagues developed for studying TMV were generalized not just to other labs working on TMV but also to research on other diseases such as poliomyelitis and influenza and to studies of genes and cell organelles The great success of research on TMV also helped justify increased spending on biomedical research in the postwar years partly through the National Foundation for Infantile Paralysis's March of Dimes a funding priority that has continued to this day
