Sudden Death Mmp:

Leukocyte-derived matrix metalloproteinase-9 in patients with coronary artery disease Simon

Jönsson,2015-02-18 Inflammation is closely associated with development of atherosclerosis The proteolytic enzyme matrix metalloproteinase MMP 9 is considered to play a prominent role in this process MMP 9 has also been introduced as a marker for plaque vulnerability Still the possible mechanisms behind altered levels of MMP 9 and its tissue inhibitors TIMPs in patients with atherosclerotic disease remain unclear The general aim of this thesis was to compare leukocyte derived MMP 9 and TIMPs in patients with coronary artery disease CAD and healthy controls and to further relate the findings to psychological stress and glucocorticoid sensitivity Levels of leukocyte derived MMP 9 and TIMP 1 showed a significant difference between CAD patients and controls Neutrophils in CAD patients were more prone to release MMP 9 and furthermore PBMCs in patients expressed higher levels of MMP 9 and TIMP 1 and 2 mRNA than PBMCs in controls while there were no differences in plasma or serum levels The increase in leukocyte derived levels of MMP 9 and TIMPs indicate the presence of preactivated leukocytes in CAD Inflammation has been proposed as a mechanistic link between cardiovascular risk and depressive symptoms We investigated whether the overexpression of leukocyte derived MMP 9 and TIMPs in CAD patients was associated with psychological factors Patients exhibited sustained elevations in depressive symptoms however these symptoms were not related to any MMP 9 or TIMP variables The findings suggest that overexpression of leukocyte derived MMP 9 and TIMPs and elevated depressive scores represent two parallel phenomena in CAD Chronic inflammation may be associated with reduced glucocorticoid sensitivity We found that PBMCs in CAD patient expressed significantly increased levels of glucocorticoid receptor GR mRNA whereas GR mRNA levels did not differ between patients and controls Moreover in ex vivo assays dexamethasone efficiently suppressed MMP 9 and TIMPs equally or even more in patients compared to controls The findings provide evidence for enhanced glucocorticoid sensitivity in CAD patients and also suggest that a state of relative hypocortisolism may contribute to the overexpression of leukocyte derived MMP 9 and TIMPs Lastly we explored the release of MMP 9 TIMPs and cortisol in response to acute mental stress in CAD patients Patients who exhibited a significant stress induced increase in serum MMP 9 also exhibited an altered cortisol response Moreover the susceptibility to stressinduced increase in serum MMP 9 was associated with shorter leukocyte telomere length and atherosclerotic plaque burden The findings highlight the existence of a high risk group which may be in need of improved diagnostic and therapeutic strategies

Cardiovascular Specific Gene Expression P.A.F.M. Doevendans, Robert S. Reneman, Marc van Bilsen, 2013-04-17 Improving our insights into the genetic predisposition to cardiovascular disease is one of the most important challenges in our field in the next millennium not only to unravel the cause of disease but also to improve the selection of patients for particular treatments Nowadays for example subjects with a cholesterol above a particular plasma level are exposed to a cholesterol lowering regime based upon the beneficial outcome of epidemiological studies which include subjects not prone to the disease despite a plasma cholesterol above the accepted level Identification of the patients who are genetically predisposed to the consequences of this disorder will reduce the number of subjects unnecessarily treated and hence the costs of health care Because in most cardiovascular diseases the genetic component is a consequence of more than one gene defect only limited progress has as yet been made in identifying subjects genetically at risk For example in hypertension only in less than 10% of the patients the genetic defect has been identified It has been known for quite some time that in heart and blood vessels fetal genes are as high blood pressure and upregulated or induced when they are exposed to such disorders ischemia Little is known about the function of

these genes in the cardiac and vascular adaptation to these disorders only guesses can be made

Atherosclerosis: Diet and Drugs Arnold Eckardstein, 2005-11-02 Cardiovascular diseases continue to be the leading cause of death in the majority of industrialized countries. The most frequent underlying pathology, namely atherosclerosis, and its clinical sequelae, namely coronary heart disease, cerebrovascular disease, and peripheral artery disease, remain common. Although for a long time we have been made aware of avoidable or modifiable etiological factors such as smoking, fat-rich diet, or lack of exercise, and although these adverse lifestyle factors have been extensively addressed by population-wide primary prevention programs, cardiovascular morbidity and mortality also remain high despite successful anti-hypertensive and lipid-lowering drug therapies which help to reduce cardiovascular morbidity and mortality by about 30% in both secondary and tertiary prevention settings. This can partly be explained by the increasing life expectancy and growing proportion of elderly people, especially in Europe and North America. In addition, the World Health Organization makes the alarming prediction that probably in response to the spreading of western dietary behavior and lack of exercise, resulting in an increasing prevalence of diabetes, dyslipidemia, and hypertension, cardiovascular diseases rather than infectious diseases will become the most frequent cause of death worldwide. This volume of the Handbook of Experimental Pharmacology, entitled *Atherosclerosis*, is divided into four parts and intends to give an overview on the pathogenesis of atherosclerosis, established treatment and prevention regimen, and of perspectives for the development of new treatment modalities.

Novel Biomarkers for Heart Disease Michael Lichtenauer, 2020-12-28 Cardiac biomarkers such as troponins and natriuretic peptides have made a great impact on clinical decision making as well as improving our understanding of molecular mechanisms of different disease conditions. However, the biomarkers that are currently in use do not reflect all the multiple disease pathways that are involved in a broad spectrum of cardiac disease conditions ranging from acute coronary syndrome to heart failure and heart failure with preserved ejection fraction (HFpEF) to pulmonary hypertension or arrhythmias. In this Special Issue, we will provide an overview of the current developments in the field of biomarker research, beginning with research on molecular pathways and cellular communication, e.g., microRNA, up to the clinical use of biomarkers.

Cardiovascular Plaque Rupture David L. Brown, 2002-02-25 Illustrating the development and determinants of possible plaque rupture, *Cardiovascular Plaque Rupture* provides an in-depth review of the pathology, etiology, cellular and molecular biology, diagnosis, and treatment of plaque in the cardiovascular system, exploring the roles of physical stress, inflammation, and infectious agents on the growth of atherosclerotic lesions.
