For reference only.

Patients with pollen-related allergies are concerned about the species within their landscape that provoke their symptoms. Allergists are often asked for guidance but few information sources are available to aid patients in the recognition of allergenic plants and strategies to avoid personal exposure to them. Landscaping and horticultural workers also have few reliable guidance references, and what is available usually extols the virtues of the plants rather than their negative features. The aim of this article was to provide the results of the Landscape Allergen Working Group that was formed by the AAAAI Aerobiology Committee, which aimed to fill these existing knowledge gaps and develop guidance on producing a low-allergenic landscape. Within the context that complete pollen

avoidance is unrealistic, the workgroup introduces selection criteria, avoidance strategies, and guidance on low-allergenic plants that could be selected by patients to reduce the overall pollen burden in their landscape environment. Specific focus is placed on entomophilous plants, which require insects as dispersal vectors and generally produce lower quantities of pollen, compared with anemophilous (wind-pollinated) species. Other biological hazards that can be encountered while performing landscaping activities are additionally reviewed and avoidance methods presented with the aim of protecting gardeners, and workers in the landscape and horticulture industries. The guidance presented in this article will ultimately be a helpful resource for the allergist and assist in engaging patients who are seeking to reduce the burden of allergen in their landscape environment. Key words: Allergy; Plants; Pollen; Landscape; Biological hazards

BACKGROUND

Plants produce reproductive propagules termed pollen that are aerosolized into local air masses. Although pollen deposition generally occurs in proximity to the source,¹ there are examples of pollen transportation across regions, states, and even entire countries.²⁻⁴ Personal pollen exposure occurs in both urban and rural settings, and airborne levels vary among species, with highest concentrations usually reported during the spring (trees), summer (weeds and grass), and fall (weeds). The lowest concentrations occur during winter. Personal exposure to pollen
