therapies such as transcranial magnetic stimulation to modulate receptivity of the damaged brain to benefit from behavioral interventions is also discussed in the context of this multimodal approach Focusing on new insights from neuroscience and imaging the book explores the potential to tailor interventions to the individual based on viable brain networks **Cerebral Small Vessel Diseases: From Vessel Alterations to Cortical Parenchymal Injury** Andreas Charidimou, Eric Jouvent, Susanne J. Cohen, 2013-11-11 Stroke is the major cause of long term disability worldwide with impaired manual dexterity being a common feature In the past few years noninvasive brain stimulation NIBS techniques such as transcranial magnetic stimulation TMS and transcranial direct current stimulation tDCS have been investigated as adjuvant strategies to neurorehabilitative interventions These NIBS techniques can be used to modulate cortical excitability during and for several minutes after the end of the stimulation period Depending on the stimulation parameters cortical excitability can be reduced inhibition or enhanced facilitation Differential modulation of cortical excitability in the affected and unaffected hemisphere of patients with stroke may induce plastic changes within neural networks active during functional recovery The aims of this chapter are to describe results from these proof of principle trials and discuss possible putative mechanisms underlying such effects Neurophysiological and neuroimaging changes induced by application of NIBS are reviewed briefly **Promoting Manual Dexterity Recovery After Stroke** Martin Lotze, Pål G.
