of state of the art studies of seafloor slope instability and their societal implications The volume captures the most recent and
exciting scientific progress made in this research field As the world s climate and energy needs change the conditions under
which slope instability occurs and needs to be considered are also changing The science and engineering of submarine or
more widely subaqueous mass movements is greatly benefiting from advances in seafloor and sub seafloor surveying
technologies Ultra high resolution seafloor mapping and 3D seismic reflection cubes are becoming commonly available
datasets that are dramatically increasing our knowledge of the mechanisms and controls of subaqueous slope failure
Monitoring of slope deformation repeat surveying and deep drilling on the other hand are emerging as important new
techniques for understanding the temporal scales of slope instability In essence rapid advances in technology are being
readily incorporated into scientific research and as a result our understanding of submarine mass movements is increasing at
a very fast rate The volume also marks the beginning of the third IGCP project for the submarine mass movement research
