present a synthetic overview of structure and function of taiga forest ecosystems in interior Alaska The data base for this work has appeared in earlier published articles including the special issue of the Canadian Journal of Forest Research Volume 13 5 1983 Stimulus for this book was a conference held in Fairbanks from June 10 14 1983 The papers presented at the conference were fore runners of the chapters in this book We invited 19 scientists from North America and England to critique our research and synthesis efforts Six of these people were asked to write introductory chapters for each section of the book Formal presentation sessions combined with field trips to research sites introduced the invitees to the primary and secondary successional ecosystems with which we were dealing A major wildfire only 24 km from the University campus was contained the week prior to the conference and one field trip provided graphic evidence of fire impact in subarctic forests The conference conveners regretted that it was not possible to host a similar meeting during synthesis efforts in mid January

Schubert,N. von Wirén,L. Wittenmayer,2006-05-18 The world s population is expected to reach 8 billion by 2025 and most of this growth in population will occur in developing countries To feed the world with such a marked increase in population a great improvement in food production must be achieved particularly in these countries To meet this challenge present agricultural productivity must be increased on the cultivated land However in many developing countries particularly in Africa reduced soil fertility caused by continuous cropping with low nutrient input and the resultant nutrient mining of soils is a major threat both to food production and to ecosystem viability As a result of declining soil fertility together with increasing population pressure expansion of crop production to marginal lands and forested areas contribute to the destruction of natural ecosystems Food production is not only a quantitative challenge Improving the nutrient status of plants provides a further valuable means of enhancing food quality and is of extreme benefit to the health of both plants and humans There are several excellent examples showing that plants with optimum nutrient status are better adapted to biotic and abiotic stress factors Because of population pressures many global food systems are not currently providing enough micronutrients to ensure adequate micronutrient intakes in the human diet This has resulted in an increasing prevalence of micronutrient deficiencies that now afflicts over three billion people worldwide Golden Gate Gardening, 30th Anniversary Edition Pam Peirce,2023-08-15 For vegetable gardening in the Bay Area Golden Gate Gardening is indispensable if you buy one gardening book this is the one Michael Pollan This fully revised 30th Anniversary edition of the ultimate food gardening
