

Introduction to Plants

Plants are multicellular eukaryotic organisms with the ability to produce their own food by the process of photosynthesis. (They are autotrophs.) Algae have historically been included with the plants, but they are now classified with the protists. The modern definition of plants includes organisms that live primarily on land (and sometimes in water), excluding algae that live primarily in water.

Another distinguishing characteristic of plants is their type of chloroplast. Chloroplasts are used to store energy from the sun during the process of photosynthesis. They have a structure called a thylakoid. In most other species of algae the sun's energy is stored in these structures, but in plants the sun's energy is stored in the chloroplasts.

Plants are divided into three groups: nonvascular plants and vascular plants. Nonvascular plants are simple, unbranched plants that live in moist environments. Vascular plants are more complex plants that have a network of tubes called xylem and phloem. The xylem carries water and minerals from the roots to the rest of the plant. The phloem carries the products of photosynthesis from the leaves to the rest of the plant. There are three main groups of vascular plants: the seedless vascular plants, the gymnosperms, and the angiosperms. The seedless vascular plants are the ferns, mosses, and liverworts. The gymnosperms are the conifers, and the angiosperms are the flowering plants. All of these groups are classified as plants, even though they are very different.

The life cycle of plants has three main stages: vegetative, reproductive, and senescent. The vegetative stage is the stage when the plant is growing and producing new leaves. The reproductive stage is the stage when the plant is producing seeds or spores. The senescent stage is the stage when the plant is dying and its leaves are falling off.

The vegetative period of a plant is the period when the plant is growing and producing new leaves. The reproductive period is the period when the plant is producing seeds or spores. The senescent period is the period when the plant is dying and its leaves are falling off. The vegetative period is the longest period of a plant's life cycle. The reproductive period is the shortest period of a plant's life cycle. The senescent period is the shortest period of a plant's life cycle.

Plants produce their own food by the process of photosynthesis. In the vegetative stage, the plant is growing and producing new leaves. In the reproductive stage, the plant is producing seeds or spores. In the senescent stage, the plant is dying and its leaves are falling off. The vegetative stage is the longest stage of a plant's life cycle. The reproductive stage is the shortest stage of a plant's life cycle. The senescent stage is the shortest stage of a plant's life cycle.
