Summer Echoes:

Middle Atmosphere Program, 1981 *Distributions of Radar Echoes Over the United States* D. D. Grantham, 1967

The frequency and probability of radar echoes of convective clouds over the United States are presented. Analysis of three years of observations from a 31 station WSR 57 weather radar network indicates that at all altitudes radar echo probabilities are greatest over Florida and the Gulf coast generally decreasing northward over the United States. Also largest probabilities for most layers and locations occur in summer. Echoes have been reported up to at least 70 kft in May, June and July and up to 60 kft in winter. Diurnal variations reveal greatest probabilities between 1600 and 2100 LST in all regions. Largest mean monthly 3 hour values are 85 percent and the maximum mean daily range is roughly 65 percent in the southeast during the summer months. The probability of an echo free horizontal view near the earth's surface for a 100 mile range is also presented. Tabulations of echo free sectors as percent of the 360 degree radar scope show that the probability of obstructions to a horizontal view increases generally from northwest to southwest during all seasons. The probability of having no echoes is greater in winter than in summer except along the Pacific coastal region. Diurnal variability is larger in July than in January.

Author *Middle Atmosphere Program* Chui-hsun Liu, Belva Edwards, 1989 Coupling Processes in the Lower and Middle Atmosphere E.V. Thrane, Tom A. Blix, David C. Fritts, 2012-12-06

The NATO Advanced Research Workshop on Coupling Processes in the Lower and Middle atmosphere held in Loen, Norway in May 1992 was in the estimation of apparently all participants an enormous success. The 18 invited speakers included many of the leaders in the field and resulted in the attendance of a large number of contributing speakers and observers. The subject of the workshop was itself very timely given the increasing awareness within the international community of the sensitivity of the atmosphere to coupling between adjacent layers, different latitudes and various scales of motion. It was also very beneficial to bring together researchers with different approaches to the same or similar problems. For example, experimentalists benefitted from the inputs of modelers and theoreticians concerning the needs of current models and the most pressing problems and unknowns. Likewise, theoreticians were challenged to apply themselves to realistic problems and saw their theories tested against geophysical data. These discussions led to meaningful exchanges of ideas and challenges to or displacement of conventional wisdom in some areas. Indeed, possibly the greatest benefit of the workshop was the exposure of many participants to other areas of research or approaches to problems relevant to their own work. Workshop topics were confined to dynamical coupling processes in order to examine progress in a relatively focussed area. Nevertheless, the results presented spanned spatial scales from molecular to global and temporal scales from seconds to decades.

The Earth's Middle Atmosphere W. L. Grose, A. Ghazi, M. A. Geller, 2016-06-06 The Earth's Middle Atmosphere covers the Proceedings of Symposium C2 and the Topical Meetings of the COSPAR Interdisciplinary Scientific Commissions A and C Meetings A7 and C4 of the COSPAR 29th Plenary Meeting held in Washington DC USA on August 28 September 5 1992 The first part covers the impact of the Upper Atmosphere Research Satellite UARS observations on middle atmosphere science This topic includes the early results of the validation and the application of the Cryogenic Limb Array Etalon Spectrometer CLAES data which is an instrumental approach to the measurement of thermal infrared spectral emission from the atmospheric limb An overview of the Halogen Occultation Experiment and the use of the UARS data in the NOAA stratospheric monitoring are also discussed in this part It also includes the observed solar UV irradiance variations of importance to middle atmosphere energetic and photochemistry as well as the stratospheric and mesospheric observations with the Improved Stratospheric and Mesospheric Sounder The second part of the book tackles the energetics and chemistry of the middle atmosphere as well as the dynamics and coupling of the middle atmosphere to regions above and below Results on the validation of the UARS wind and temperature measurements at and above the mesopause comprise the third part of this book This book will be a great value to geophysicists and atmospheric scientists

The Upper Mesosphere and Lower Thermosphere R. M. Johnson, T. L. Killeen, 1995-01-09 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 87 This volume provides a review of progress made in recent years in experimental and theoretical investigation of the upper mesosphere and lower thermosphere and coupling between these regions and the ionosphere Detailed study of the mesosphere lower thermosphere ionosphere MLTI region has historically been difficult because of its relative inaccessibility

to direct measurement techniques and the complex and highly coupled processes which occur there. Although we have still not successfully unraveled all these complex interactions, we have made significant recent progress toward a fuller understanding of the basic state of the MLTI and of the dominant wave and coupling processes. This monograph includes a set of tutorial papers which review our current understanding of aspects of the MLTI. These tutorials are interspersed with a selection of papers describing research progress on various topics of current interest in this region. The book should therefore be useful both to the newcomer as an introduction to this field of research and to the more experienced researcher providing an overview of research in progress as well as a convenient reference collection of papers describing our current understanding.

Propagation of Short Radio Waves Donald E. Kerr, 1987. This book treats the phenomena associated with the propagation of short radio waves between terminal points, whether they be the radar antenna serving a dual purpose or the antennas of a communications system. The intention is to present a summary of the state of knowledge in the microwave propagation field at the close of the war. There has been no attempt to produce either a handbook or textbook but only an interim report on a rapidly changing subject. An attempt has been made to survey all relevant information that was available.
