Skin Immune System Sis:

Skin Immune System (SIS) Jan D. Bos, 1997-04-10 Immunodermatology is a field covering the majority of skin diseases including the most prevalent ones in the general population. The Second Edition of Skin Immune System SIS discusses immune mediated skin diseases and disease groups in which the SIS plays a role. It covers major findings in immunophysiology and immunopathology that have occurred since the introduction of the First Edition in 1990. As the subtitle indicates, the Second Edition adds a new emphasis on cutaneous immunology and also includes new information on immune based therapeutic interventions and methods such as phototherapy and the immunological therapy of skin cancer. The book contains Part I with introductory chapters, Part II with descriptions of the cellular elements, and Part III which describes the humoral and molecular components of SIS. Part IV follows to integrate the facts described in Parts II and III into concepts of pathophysiology. It contains a number of concepts entitled response patterns that describe how the constitutional elements of SIS work together. New in this edition are the descriptions of immunodermatological diseases individually described in Part V. Part VI is also all new and summarizes principles of immunotherapy.

skin diseases Skin Cancer after Organ Transplantation Eggert Stockfleth, Claas Ulrich, 2009-05-05 Organ transplantation has been performed for almost 40 years with steadily increasing success regarding long time survival of the graft as well as quality of life for the patient. However, graft tolerance only can be achieved via induction and maintenance of an impaired immunological surveillance. An increase of skin cancers as a consequence of the lowered cellular immunoresponse seems to parallel the overall increased long time survival rate of organ transplant recipients. Against the background of chronic immunosuppression, known risk factors like the amount of sun exposure prior and post transplantation, oncogenic viruses as well as the genetic background and place of residence, latitude are strongly related with the increased skin cancer incidence. The increasing incidence of non-melanoma skin cancer paralleling a prolonged survival of patients after organ transplantation represents a significant reason for morbidity and long term morbidity in organ transplant recipients worldwide. The incidence of non-melanoma skin cancer in liver, kidney and heart transplant recipients varies from 1.5 to 22 % to 24 % and 6 to 34 % after 5 years post transplant. Ultraviolet radiation as well as immunosuppressive therapy are crucial risk factors regarding the induction and progression of skin cancer. Ultraviolet radiation is related to the induction of DNA damage as well as interference with Langerhans cell antigen presentation and a Th1/Th2 shift induced via a release of IL-10. Whereas the overall duration of immunosuppression and the cumulative dosage applied are relevant parameters in the evaluation of an increased tumor risk, individual differences between specific immunosuppressive agents remain unclear. The workup of genetic as well as other unclear phenomenon like the reverse BCC/SCC ratio might shed some further light into the genesis and immunology of the non-melanoma skin cancer in general. *Clinical and Basic Immunodermatology* Anthony Gaspari, Stephen K. Tying, 2008-11-05 Dermatologists are being asked to understand the pathophysiology of a number of immune-mediated skin diseases. In addition, a number of new products have appeared on the market during the past decade which requires an understanding of the mechanisms of action of these drugs. Dermatologists however have no easily understood book to which they can refer to regarding the disease or the drug. Handbook of Mouse Mutations with Skin and Hair Abnormalities John P. Sundberg, 2020-08-26 Handbook of Mouse Mutations with Skin and Hair Abnormalities presents 48 mouse mutations that are all available to the biomedical community. Many of the mouse mutations with dermatological diseases are reviewed and illustrated in detail. This popular reference book gives you a single source to use when determining which mouse mutation will best serve your needs as a biomedical tool for sophisticated research projects. The book also includes an overview of domestic animal genodermatoses to provide alternatives to mouse models that do not exist or to complement those that do. A detailed section written by renowned experts compares the biology of human and mouse skin and skin diseases in the areas of development and the use of animal models, mammalian genetics, keratin biochemistry, epidermal and hair follicle cycles and kinetics, cytokines and growth factors, keratinocyte culture systems, cutaneous carcinogenesis, cutaneous immune system and skin changes associated with mutations of the endocrine system.
