Sound System Engineering Don Davis,Eugene Patronis,2014-06-20 Sound System Engineering Third Edition is a complete revision and expansion of the former work Written by two leading authorities in the field of audio engineering this highly respected guide covers the fundamentals necessary for the understanding of today s systems as well as for those systems yet to come The space formerly occupied by outdated photographs of manufacturers product and of older system installations has now been filled with new measurements and discussions of the measurement process The Mathematics for Audio chapter has been expanded to include the mathematics of phasors The Interfacing Electrical and Acoustic Systems chapter has a completely new section covering the analysis of alternating current circuits Additionally system gain structure is now treated by both the available input power method and the voltage only method complete with illustrations of each All chapters dealing with loudspeaker directivity and coverage the acoustic environment room acoustics speech intelligibility and acoustic gain appear in up to date versions In addition there is new material on signal delay and synchronization and equalization There are completely new chapters on microphones loudspeakers and loudspeaker arrays including line arrays with steering and beam width control and signal processing both analog and digital The book runs the gamut of sound system design from the simplest all analog paging system to the largest multipurpose digital systems In writing this third edition the authors kept in mind the needs of sound system installers sound system service technicians and sound system designers All three groups will find the material to be useful for everyday work as well as beneficial in the furtherance of their overall audio education *Modeling the Radiation of Modern Sound Reinforcement Systems in High Resolution* Stefan Feistel,2014 Starting from physical theory this work develops a novel framework for the acoustic simulation of sound radiation by

loudspeakers and sound reinforcement systems First a theoretical foundation is derived for the accurate description of simple and multi way loudspeakers using an advanced point source CDPS model that incorporates phase data The model s practical implementation is presented including measurement requirements and the GLL loudspeaker data format specification In the second part larger systems are analyzed such as line arrays where the receiver may be located in the near field of the source It is shown that any extended line source can be modeled accurately after decomposition into smaller CDPS elements The influence of production variation among elements of an array is investigated and shown to be small The last part of this work deals with the consequences of fluctuating environmental conditions such as wind and temperature on the coherence of sound signals from multiple sources A new theoretical model is developed that allows predicting the smooth transition from amplitude to power summation as a function of the statistical properties of the environmental parameters A part of this work was distinguished with the AES Publications Award 2010 Parts of the proposed data format have been incorporated into the international AES56 standard
