Spreading Fires:

How to Predict the Spread and Intensity of Forest and Range Fires Richard C. Rothermel, 1983 This manual documents procedures for estimating the rate of forward spread intensity flame length and size of fires burning in forests and rangelands Contains instructions for obtaining fuel and weather data calculating fire behavior and interpreting the results for application to actual fire problems

Wildland Fire Behaviour Mark A. Finney, Sara S. McAllister, Jason M. Fortthofer, Torben P. Grumstrup, 2021-11 Wildland fires have an irreplaceable role in sustaining many of our forests shrublands and grasslands They can be used as controlled burns or occur as free burning wildfires and can sometimes be dangerous and destructive to fauna human communities and natural resources Through scientific understanding of their behaviour we can develop the tools to reliably use and manage fires across landscapes in ways that are compatible with the constraints of modern society while benefiting the ecosystems The science of wildland fire is incomplete however Even the simplest fire behaviours how fast they spread how long they burn and how large they get arise from a dynamical system of physical processes interacting in unexplored ways with heterogeneous biological ecological and meteorological factors across many scales of time and space The physics of heat transfer combustion and ignition for example operate in all fires at millimetre and millisecond scales but wildfires can become conflagrations that burn for months and exceed millions of hectares Wildland Fire Behaviour Dynamics Principles and Processes examines what is known and unknown about wildfire behaviours The authors introduce fire as a dynamical system along with traditional steady state concepts They then break down the system into its primary physical components describe how they depend upon environmental factors and explore system dynamics by constructing and exercising a nonlinear model The limits of modelling and knowledge are discussed throughout but emphasised by review of large fire behaviours Advancing knowledge of fire behaviours will require a multidisciplinary approach and rely on quality measurements from experimental research as covered in the final chapters

A Mathematical Model for Predicting Fire Spread in Wildland Fuels Richard C. Rothermel, 1972

A Fire Management Simulation Model Using Stochastic Arrival Times Eric Leon Smith, 1987 Fire management simulation models are used to predict the impact of changes in the fire management program on fire outcomes As with all models the goal is to abstract reality without seriously distorting relationships between variables of interest One important variable of fire organization performance is the length of time it takes to get suppression units to the fire Because the location of the fires cannot be predicted and because suppression units are not always available at a particular base location the types of units sent and their arrival times vary This aspect of fire modeling which is especially important in representing simultaneous fires and in choosing base locations has not previously been examined

Effects of Fire on Madrean Province Ecosystems, 1996

Wildland Fire Dynamics Kevin Speer, Scott Goodrick, 2022-06-30 An overview of recent advances in the quantitative modeling of wildland fire based on fluid dynamics including a discussion of the mathematical and dynamical principles

Providing a state of the art survey it is a useful reference for scientists researchers and graduate students interested in fire behavior from a range of fields **Field Procedures for Verification and Adjustment of Fire Behavior Predictions**

Richard C. Rothermel, George C. Rinehart, 1983 The problem of verifying predictions of fire behavior primarily rate of spread is discussed in terms of the fire situation for which predictions are made and the type of fire where data are to be collected Procedures for collecting data and performing analysis are presented for both readily accessible fires where data should be complete and for inaccessible fires where data are likely to be incomplete The material is prepared for use by field units with no requirements for special equipment or computers Procedures for selecting the most representative fuel model for overall evaluation of prediction capability and for developing calibration coefficients to improve future predictions are presented Illustrated examples from several fires are included The material is a companion publication to the fire prediction manual titled INT GTR 143 How to predict the spread and intensity of forest and range fire by R C Rothermel **Fire Management**
