T-Cell Subsets and Cytokines Interplay in Infectious Diseases A. S. Mustafa, R. J. Al-Attayah, I. Nath, T. D. Chugh, 1996-03-05 *Biological Signals*, 1996 **International Conference "T-cell Subsets and Cytokines Interplay in Infectious Diseases"**, 1993 *Infection and Immunity* D H Davies, M A Halablab, T W K Young, F. E. G. Cox, J. Clarke, 2002-09-11 This concise text explores the interactions between pathogens and the immune system Taking a disease based approach it explains how micro organisms adapted to growth in human hosts can evade the immune system and cause disease The opening chapter overviews the innate and adaptive immune responses to microbes Subsequent chapters are specific *Medical Principles and Practice*, 1996 *Immune evasion strategies in protozoan-host interactions* Alexandre Morrot, 2024-08-13 The protozoa are the most ancient members of the animal kingdom and they have evolved the intracellular parasitism to ensure their survival strategies Protozoan parasites that infect humans are extremely diverse among eukaryotes They are responsible for many human diseases such as amebiasis Chagas disease malaria toxoplasmosis leishmaniasis and African sleeping sickness The ability of protozoans to cause disease depends on the nature and number of infecting organisms the route of infection the virulence factors associated with the microorganism and the strength of host defenses This host parasite interaction is also subject to constant change as the infection proceeds and can lead to a range of outcomes from elimination of the pathogen to death of the host depending on the states of latency and the extent of colonization that the protozoan achieves in the course of infection Several species of parasitic protozoa harbor specialized virulence factors whose products can overcome the host's immunity and promote their survival These factors act at several different checkpoints of the host immune responses from the first components of the innate immune response to the induction and maintenance of adaptive memory responses Many protozoan species have evolved mechanisms that modulate and inhibit host sensors microRNA circuits and signaling pathways that permit the host to detect infection These factors can act inter alia by inhibiting the complement cascade subverting phagocyte activation and impairing leukocyte migratory responses so undermining the immune system thus facilitating the pathogen evasion and its continued persistence in the host In this research topic we welcome the contribution of original research article as well as reviews on the field

Orange, Eric Vivier, 2017-11-29 Natural Killer NK cells were discovered ca 1975 as the first group of lymphoid cells that were neither T cells nor B cells Since then the dissection of the biology of NK cells has been growing exponentially with many seminal discoveries from the identification of MHC class I specific inhibitory receptors to the discovery of receptor ligand pairs involved in NK cell activation and to the manipulation of NK cells in cancer In this research topic we asked a group of thought leaders in NK cell biology to review recent advances in their origins and biology and their roles in cancer infection and inflammation Together these 25 articles provide a timely survey of NK cells as critical immunologic components of health and disease They will hopefully prompt further dialogue and developments in basic and translational immunology Tropical Diseases Bulletin ,1996 **The Interplay Between**

great advances in diagnosis and treatment that we witnessed in the last decades over a billion people suffer from both respiratory and neurological diseases each year which poses great threats to the public health and economic burden worldwide. In many instances the underlying pathogenic mechanisms are still poorly understood which significantly limits the efficacy of therapeutic methods. In this regard lines of evidence pinpoint the important role of immunity and inflammation in both respiratory disorders e.g. pulmonary hypertension, chronic obstructive pulmonary disease, asthma etc. and neurological ones e.g. neurodegenerative diseases, stroke, depression etc. The accumulation of inflammatory cells and an excess of cytokines and chemokines at the inflammatory site would result from the disturbance of the body's delicate balance between immunity and tolerance. Therefore it gives rise to chronic inflammation and autoimmunity underlying the development of both lung and neurological diseases. Furthermore the inflammation interaction between lung and brain has been identified suggesting the existence and importance of the lung-brain axis in the regulation of immune responses in the lung and brain that contribute to the onset and progression of both respiratory and neurological diseases. Nevertheless inflammatory or immunity-related risk factors as well as novel targets and therapies against inflammation or immunity help early diagnosis and treatment of respiratory and neurological diseases. At present the full picture of the molecular mechanisms of how immune-inflammatory activation and the immune cells orchestrate the tissue remodeling leading to respiratory and neurological diseases remains unclear. The identification of inflammatory molecules as therapeutic targets or biomarkers are worth further scrutiny to halt the disease progression and monitor the therapeutic interventions.
