**Literature** William M. Barton, 2016-10-26 In the late Renaissance and Early Modern period man's relationship to nature changed dramatically. An important part of this change occurred in the way that beauty was perceived in the natural world and in the particular features which became privileged objects of aesthetic gratification. This study explores the shift in aesthetic attitude towards the mountain that took place between 1450 and 1750. Over the course of these 300 years the mountain transformed from a fearful and ugly place to one of beauty and splendor. Accepted scholarly opinion claims that this change took place in the vernacular literature of the early and mid 18th century. Based on previously unknown and unstudied material, this volume now contends that it took place earlier in the Latin literature of the late Renaissance and Early Modern period. The aesthetic attitude shift towards the mountain had its catalysts in two broad spheres: the development of an idea of landscape in the geographical and artistic traditions of the 16th century on the one hand, and the increasing amount of scientific and theological investigation dedicated to the mountain on the other, reaching a pinnacle in the late 17th and early 18th centuries. The new Latin evidence for the change in aesthetic attitude towards the mountain, unearthed in the course of this study, brings material to light which is relevant for the current philosophical debate in environmental aesthetics. The book's concluding chapter shows how understanding the processes that produced the late Renaissance and Early Modern shift in aesthetic attitude towards the mountain can reveal important information about the modern aesthetic appreciation of nature. Alongside a standard bibliography of primary literature, this volume also offers an extended annotated bibliography of further Latin texts on the mountains from the Renaissance and Early Modern period. This critical bibliography is the first of its kind and constitutes an essential tool for further study in the field.

Heydenreich, Florian Klaefer, Klaus Mecke, Dirk Vanderbeke, Jörn Wilms, 2024-12-30 In the Middle Ages and early modernity celestial observation was frequently a subject for verbal rather than numerical and geometrical recording. These records can now be difficult to decode since what they address is frequently obscured by formal conventions of genre, imagery, rhetoric, prosody, to name but a few. The volume collects essays exploring such configurations between literature and observation from Europe to China. How contributors ask were verbal representations of celestial phenomena encoded and self-consciously placed vis-à-vis other systems of representation and knowledge? What kinds of data are represented and what are the modes in which they are communicated? What interpretational problems arise when present-day disciplines like climatology, meteorology, geophysics, and astronomy but also literary studies try to access them? How were discourses on religion, law, anthropology, aesthetics, colonialism, etc. linked in and through their verbal presentation with astronomical observation and

*Painting the Heavens* Eileen Reeves, 1997

The remarkable astronomical discoveries made by Galileo with the new telescope in 1609 led to his famous disputes with philosophers and religious authorities most of whom found their doctrines threatened by his evidence for Copernicus's heliocentric universe. In this book Eileen Reeves brings an art historical perspective to this story as she explores the impact of Galileo's heavenly observations on painters of the early seventeenth century. Many seventeenth century painters turned to astronomical pastimes and to the depiction of new discoveries in their work yet some of these findings imposed controversial changes in their use of religious iconography. For example Galileo's discovery of the moon's rough topography and the reasons behind its secondary light meant rethinking the imagery surrounding the Virgin Mary's Immaculate Conception which had long been represented in paintings by the appearance of a smooth incandescent moon. By examining a group of paintings by early modern artists all interested in Galileo's evidence for a Copernican system Reeves not only traces the influence of science on painting in terms of optics and content but also reveals the painters in a conflict between artistic depiction and dogmatic representation. Reeves offers a close analysis of seven works by Lodovico Cigoli, Peter Paul Rubens, Francisco Pacheco and Diego Velázquez. She places these artists at the center of the astronomical debate showing that both before and after the invention of the telescope the proper evaluation of phenomena such as moon spots and the aurora borealis was commonly considered the province of the painter. Because these scientific hypotheses were complicated by their connection to Catholic doctrine Reeves examines how the relationship between science and art and their mutual production of knowledge and authority must themselves be seen in a broader context of theological and political struggle.

**The Seven liberal Arts** Paul Abelson, 1906      *Solar System Maps* Nick Kanas, 2013-09-25

In recent years there has been increased interest in our Solar System. This has been prompted by the launching of giant orbiting telescopes and space probes, the discovery of new planetary moons and heavenly bodies that orbit the Sun, and the demotion of Pluto as a planet. In one generation our place in the heavens has been challenged but this is not unusual. Throughout history there have been a number of such world views. Initially Earth was seen as the center of the universe and surrounded by orbiting planets and stars. Then the Sun became the center of the cosmos. Finally there was no center just a vast array of galaxies with individual stars, some with their own retinue of planets. This allowed our Solar System to be differentiated from deep sky objects but it didn't lose its mystery as more and more remarkable bodies were discovered within its boundaries. This book tells the exciting story of how we have conceptualized and mapped our Solar System from antiquity to modern times. In addition to the complete text, this story is made more vivid by 162 Solar System and planetary maps, diagrams, and images, over a third in color, direct quotes, and figures from antiquarian, contemporary, and Space Age documents and photographs that allow the reader to track how humans have viewed the Solar System from original sources. Nine tables that compare the various world views, relative planetary positions, and components of the Solar System with each other. Broad in scope and rich in imagery, this book will draw the reader into the story of our Solar System and how it has been mapped since the beginning of
